NEW-YORK, FEBRUARY 2, 1856.

Heat and Cold Phenomena.-The Cause. and cold, and we are quite sensitive in our feelings on the subject. But what is heat, and what is cold ? Many theories have been advanced respecting heat, all the authors of which seem to have committed the blunder of supposing the vhad demonstrated what heat is, by merely describing its effects. We have never heard of an attempt being made to explain what cold is, beyond that lucid one, "it is the absence of heat," and which is just as applicable to heat, -"it is the absence of cold." Both heat and cold produce peculiar effects.

By heat, substances are made to expand, metals to assume the form of gas, and the flinty rock to run like water. Cold, on the other hand, reduces fluids to solids, but like heat it also expands substances. Strong cannon have been burst to pieces, as with gunpowder, by filling them with water and submitting them to severe cold. Rocks are split asunder, and limbs of trees are burst from their trunks during intense cold. If heat is a substance, as is asserted by some, why may not cold be asubstance also? The fact is that heat and cold are just terms in general use for describing certain effects arising from a cause, or from causes not yet distinctly known. We know something respecting the operations of gravity, but no person can tell what gravity is; and it is the same with heat and cold. Faraday has come to the conclusion that all the forces of nature may be traced to electricity in different conditions; and heat and cold being forces of nature would come under his classification as electrical phenomena. The recent "cold term" or cycle, experienced through such an extent of our continent seems to favor his hypothesis, at least so we would conclude from the information published on the subject by E. Merriam, the well-known meterologist. He states that this cold term lasted thirty days, and that very intense cold was experienced in many places which heretofore always enjoyed mild winters. At Waverly, Mo., on the Missouri river, the temperature on the 25th of December was 24 deg. below zero; and on the 9th of this month it fell again to the same point; and had there been a wind prevailing at the time, it is believed that all the live stock in that part of the country would have perished, as the temperature was more like that of the Arctic regions than that of the mild southwest of the United States. Mr. Merriam says, in relation to the severe cold, "it must come down from the high mountains and from the great ethereal where the cold holds perpetual dominion. He also alludes to the recent eruption of the great volcano in the Sandwich Islands as having something to do with it, and says: "from the gigantic crater, nine miles in circumference, such a volume of electricity is | Whatever is to be done should be done quickly. discharged into the ethereal that human estimate cannot count it up." These remarks favor the views of Faraday respecting electricity being the cause of natural forces.

On the 12th and 13th ult. myriads of live black bugs fell on the snow at Fairfax, Va, and covered it as with a mantle of velvet; and many other strange things have also taken place during this cold term, such as the shock of an earthquake felt at Ogdensburgh, N. Y., on the 6th ult., several shocks in Virginia on the 9th, and an electric cloud, which sent extension. On no principle of right or justice forth a current of great length, on the 19th. As earthquakes have heretofore been attributed and help to put the millstone round their electricity, the shocks mentioned in connection with the recent cold term, furnish further proof in favor of Faraday's theory; so that it may be positively true, that the same cause which plates a tea-spoon and dispatches a telegraph message, also sends us our cold and hot terms.

By recent accounts from Europe we learn that the cold has been as intense there as it has been here. At Odessa, on the Black Sea, the thermometer stood for several days at 27 ° below zero, and many persons had been frozen to death in their beds. It had also been very cold in England. We have often heard it asserted that when we had a cold winter in

tinents. We wonder if philosophers have ob- | South street, is treasurer. served any peculiarity in the dip of the magnetic needle during such severely cold seasons? History of Gas Lighting-Who was its Inventor. kind in 1822; explained its use, and operated

Governors and State Legislatures.

During the progress of the memorable efforts made in 1852 to foist the Woodworth extension bill upon Congress, the attention of many of the State Legislatures became turned to the subject and some of them passed resolutions instructing their Senators and Representatives at Washington to use their influence and their votes against the passage of the act. These resolutions had a powerful effect, and contributed, perhaps as much as any one cause, at that time, to the signal defeat of the scheme. In less than one year from to-day this ven-

erable monstrosity, if ignored by the present Congress, will die a natural death. Its lease of life expires, by law, in December, 1856, and after that time, unless the patent is now renewed, it will trouble no one. It is fully sensible of this fact, to speak figuratively. It knows that its dying hour approaches, and it is mustering all its forces with a view to avert the catastrophe; it is about to make a grand final struggle. Its most powerful agent is money. Richer than Crossus, it is lavish in its expenditures and profuse in its promises. To obtain influence or put down opposition, it freely pays gold. Its great hope is, directly or indirectly, to subsidize Congress; to effect this purpose, secret agents are busily at work, in many directions, concentrating every possible influence that will aid in carrying out the end. If the votes of less than half the members can, in any manner, be secured, the victory will be won, and the whole country will once more be laid under disgraceful tribute to its avarice. For vears the patent has brought inan annual revenue of over three millions dollars. Vast sums can be afforded to be of spent to secure its continuance: but, if successful, the re-payment of these amounts, ten thousand times over, will be required, and the money must come from the earnings of hardorking, industrious people.

Under these circumstances we appeal to the Governors and Legislatures of our States to lend their assistance, for the last time, towards the suppression of this gigantic wrong. We ask them to draw up messages, to pass resolutions, to direct Congressional Representatives, and to exercise every other power within their control to prevent its consummation.

We call upon good men, everywhere, for aid. Citizens of all classes can greatly assist in this matter, if they are so disposed; we hope they will, for once, do their whole duty. Let them write letters to friendly Members of Legislatures requesting attention to the subject, and explaining its necessities. Let them keep petitions in constant circulation, and send them, as often as possible, to Washington. Let them be up and doing, for there is danger in delay.

Remonstrances to the Woodworth Patent Extension

We would again remind our readers that printed petitions of remonstrance against this outrageous scheme can be had gratis, on application at the SCIENTIFIC AMERICAN office. Enclose a stamp for postage.

One more vigorous effort made and the monster receives his death-blow. The parties interested are earnestly seeking, to obtain the can they succeed Come forward, one and all, necks.

Life Benevolent Association.

When the rope, and vice versa; but the past and present of this Association. It appeals to the public article describing it was published, Silas Dinswinters have been equally severe on both con for support. Robert C. Goodhue, Esq., No. 64 more, of Mobile, Ala., answered it, stating

We have lately noticed a paragraph in a it publicly before a large crowd of citizens. We have heard and read much about heat 1785. The following is an extract from the paragraph referred to :---

> order to obtain from it gas, oil, pitch, and pypossibility of obtaining gas by distillation ter wheel. from fatty or oily substances. He eventually died, ruined by his experiments. The English soon put in practice the crudeideas of Le Bon. In 1804, Windsor patented and claimed the credit of inventing the process of lighting by gas; in 1805 several shops in Birmingham were illuminated by gas manufactured by the process of Windsor and Murdoch; among those who used this new light was Watt, the inventor of the steam engine. In 1816 the first use was made of gas in London, and it was not until 1818 that this invention, really of French origin, was applied in France."

So far from the foregoing being correct, gas was made from coal in England in 1688. The Rev. Mr. Clayton, of Crofton, Yorkshire, who had visited Virginia, in giving an account of his observations in that colony to the Royal Society, compared the nature of the violent thunder of Virginia to the spirits which he had drawn from coals, and exploded, and which he had caught in bladders, and burned until it was consumed, which was nothing less than coal gas. Dr. Watson, in his Chemical Essays, in 1773, describes the process of distilling Newcastle coal in a retort, and obtaining inflammable gas therefrom. The discovery of ! making gas from coal was therefore made long before Le Bon's day; yet there can be no doubt but this French engineer made illuminating gas from wood, wihtout any knowledge of what the English chemists had done before. W. Murdoch, spoken of in the above extract, illuminated his own house and his office with gas, in Redruth, Wales, in 1792, and was the first person who introduced it into public use. for steam navigation-he brought it into suc- | ed. Annexed are the rules : cessful public use.

We have seen a statement in one of our cotemporaries to the effect, that no method yet employed to purify coal gas, has been effectual in separating the sulphuretted hydrogen from it. It is indeed true that there are some iron in the special reasons, to be shown by the applicant. Models filed as exhibits, in interference and other cases, should also, as far as practicable conform to this rule as to size. Should they pyrites in all coals used for making gas, and both ammonia and sulphurous gas are produced from coals with the carburetted hydrogen gas. But then the process of separating these impure gases perfectly, is well known. If the gas is first passed through a solution of the sulphate of iron, and then through the common lime purifyer, and then washed in water, every trace of sulphurous acid and ammonia will be removed from it.

Water Wheel Railroad.

On page 137, we copied a short article from the London Athenaum describing a new method of drawing up railroad cars on a steep in- ly affixed thereto." cline on the Mt. Cenis Railroad, Piedmont.-The plan was described to consist of a water and also at the U.S. PatentOffice, come packed wheel operated by the power of a descending in cotton. If oil paint or a slowly drycurrent, and made to ascend the incline, by ing varnish has been used, the model, by the having its shaft bearing on side rails, and its time it reaches its destination, is thoroughly buckets in the water, and thus to draw the deprived of its beauty by the firm adherence train of cars after it. We stated that the of the cotton to its parts. If cotton is not used plan in all likelihood was not correctly de- dust generally takes its place, and becomes scribed by the Athenaum, and that it probably cemented to the model. For the prevention of consisted of a more reasonable method, viz. :- this vexation we herewith present an excellent that of a fixed water wheel at the foot of the recipe: There is an Association composed of the incline, for drawing up the train by an endless

We would really like to see such a wheel in vention of gas lighting to Phillip Le Bon, an operation on an incline of about 69 feet to the engineer of roads and bridges in France, in mile. At present we cannot see how it would ascend it, and therefore we do not believe it could. If it will work, a paddle-wheel boat "Le Bon commenced by distilling wood, in may yet be made to climb up Niagara Falls. The covetousness of no man should be excited roligneous acid, but his work indicated the respecting the authorship of this railro d wa-

Important to Inventors and Model Makers.

Too many applicants for patents, disregard the rules of the Patent Office in preparing their models, and thereby cause themselves unnecessary trouble and expense. Numbers of models are constantly refused by the Department on account of their being too large, too imperfectly constructed, or not properly painted or polished, to meet the official requirements. Before us lies a letter from the Commissioner, which we will publish, giving the names of the interested parties, in initial, as a warning to others who may happen to be engaged in the construction of models for applications for patents, or soon intend to do so :

"U. S. PATENT OFFICE, Jan. 22, 1856. GENTLEMEN-The models in the following late applications can be repaired by the Office for the prices annexed :

1. D.C.T.-Water Wheels,-broken; charge for repairs, \$1,50.

2. A. & T. S. S.-Gang Plow,-broken; charge for repairs, \$2. 3. A. A.—Screw Propeller,—too large;

charge for reducing, \$1. 4. W. H. B.-Spike Machine,-charge for

painting, \$1. 5. J.S. G.-Converting a Reciprocating into a Rotary Motion, &c.-requires painting; Very respectfully, charge, \$1.

C. MASON, Com.

Messrs. Munn & Co., New York."

For the further information of all our readers, we subjoin the official rules in respect to models. If properly observed by model ma-He did for gas illumination what Fulton did kers, the troubles we have named will be avoid-

"The model must be neatly and substantially made of durable material, and not more than one foot in length or hight, except when exceed this limit, they will not be preserved in the Office after the termination of the case to which they belong. If made of pine or other soft wood, they should be painted, stained, or varnished.

A working model is always desirable, in order to enable the Office fully and readily to understand the precise operation of the ma-chine. The name of the inventor, and also of the assignee (if assigned,) must be fixed upon it in a permanent manner.

When the invention is of a composition of matter, a specimen of the ingredients and of the composition, which the law requires, must accompany the application, (see act of 1836, section 6,) and the name of the inventor and assignee "(if there be one) must be permanent-
