### Recent American Patents.

Improvement in Weighing Scales.—By S. S Mills and M. Bissell, of Charleston, S. C .- Instead of one arm or lever as employed in the common weighing apparatuses, the inventors on each. This arrangement, although simple, possesses several advantages. It permits the permanent attachment of the weights to the arms, and thus prevents the inconvenience that often occurs in shops from the loss or misplacing of the weights. It also affords great convenience in ascertaining the tare of the article, for one of the weights may be moved so as to indicate the tare, while another will show the gross sum. This improvement is cheap in construction, is much superior to the single lever scales, and is adapted for use in connection with nearly all kinds of weighing contrivances.

Improvement in Reaping Machines.—By Alexander H. Caryl, of Sandusky, Ohio. - This improvement relates to the raking apparatus of reaping machines. The platform is composed exceedingly pure state. This is a very simple of wooden slats slightly separated. The rake teeth project up through the slats, and the head to which the teeth are attached is moved back and forth beneath the platform, by means deed it is the metal which forms almost every of peculiar mechanism.
