

Improved Gaiter.

The ordinary tongue piece inserted in shoes and gaiter boots is more trouble than benefit, for it is generally found curled up in the toe of the shoe, or else is soon pulled out and thrown away by the impatient wearer, who takes this summary method of disposing of a nuisance. The attachment here shown is not, in common phrase, a tongue, but serves the same, and, in fact, a better purpose than the part in question.

It consists of a leather flap, A, sewed to each side of the shoe, as clearly depicted in the engraving. By this plan the shoe is rendered more slightly—more comfortable to the wearer, and excludes dust and wet much more effectually than the common tongue. This lining can be applied either in front, at the side, or in the rear of the shoe, and can be ornamentally stitched or embossed in any manner to suit prevailing fashions. It is a useful improvement and should become popular.

It was patented through the Scientific American Patent Agency on Sept. 19, 1865, by Thomas Powell. For further information concerning the sale of State rights, or entire patent, address him at Richland, Indiana.

**POWELL'S IMPROVED GAITER.****AMERICAN TORPEDOES IN ENGLAND.**

Our old friend, G. W. Beardslee, is making a great noise in England with torpedoes for blowing up vessels. It has been well known since the time of Fulton that there is no difficulty in blowing up any vessel by placing a sufficient quantity of gunpowder beneath her keel, and setting fire to it; the only difficulty is in getting the vessel just over the powder, and then setting the powder on fire. The most approved method of firing the powder is by electricity. Two insulated copper wires are lead from a galvanic battery—one from each pole—into the mass of powder, and their ends are connected by a smaller piece of platinum wire. This platinum wire, being a poorer conductor of electricity, refuses to carry all the current, and, as Tyndall would say, a portion of the electricity is converted into heat—at all events, the platinum wire becomes red hot and fires the powder. This was employed a number of years ago by Prof. Mallefert in blowing up the rocks in this harbor and Hell Gate. Mr. Beardslee's improvement consists in substituting a fine line of plumbago for the platinum wire, which enables a much feeblere current of electricity to be employed. He inserts the ends of the two copper wires into a cork about half an inch apart, and marks the cork between the two with a lead pencil; on establishing the electric current the pencil mark is heated, and the gunpowder fired. Before Mr. Beardslee left for England, he said that he had, by this arrangement, fired a torpedo in Washington with electricity generated by a machine situated in New York.

A Good Washing Machine.

One of the best labor-saving machines ever introduced into a household is a good washing and wringing machine. No class of patented machines so much interest the good housewife as the washing machine and wringing attachment. The terrors of washing day exist no longer where a good one is in use, and any of our readers in want of a first-class machine—one that has no rival, to our knowledge—are advised to send to Messrs. Oakley & Keating, No. 184 Water street, for a circular, and then purchase from them such a size as they may require.

BRODHEAD'S BORING TOOL.

Wood workers and others often find it necessary to make holes of large diameter in their work. To do this a bit is commonly used, a number of small holes being bored around the circumference of the

circle, and the segment left afterward removed by a chisel or saw. This process is not only slow but very rude, for it is impossible to make a true hole by the plan mentioned except at the expense of time.

With the tool here shown, a perfect circle can be easily made, and the hole handsomely finished at one job.

The details are simply a rod, A, furnished with a fine threaded screw, and formed into a boring bit, B, at the end; also a crossbar, C, sliding in a mortise in the rod, A. The crossbar carries the cutting tool,

D, which can be set at any distance from the center within its range and held there by the thumbscrew, E. The operation is too obvious to require explanation. It is used with an ordinary brace, or may be attached to a lathe, and the cut is made continuous by the fine feed screw on the shank of the rod, A.

This desirable and efficient tool was invented and patented on August 8, 1865, by Wessel Brodhead, of Rondout, N. Y., and assigned to C. L. Edmonds, of the same place, all through the Scientific American Patent Agency. For further information address Mr. Edmonds as above.

The receipts of the Government from internal revenue, since June 30th last amount to \$137,365,382.

TO
INVENTORS, MECHANICS, AGRICULTURALISTS,
THE ANNUAL
PROSPECTUS.

OF THE
Scientific American.

THE CHEAPEST AND BEST
MECHANICAL JOURNAL IN THE WORLD
A NEW VOLUME OF WHICH COMMENCED
JULY 1, 1865

This valuable journal has been published nineteen years, and during all that time it has been the firm and steady advocate of the interests of the Inventor, Mechanic, Manufacturer and Farmer, and the faithful chronicler of the

PROGRESS OF ART, SCIENCE AND INDUSTRY

The SCIENTIFIC AMERICAN is the largest, the only reliable and most widely-circulated journal of the kind now published in the United States. It has witnessed the beginning and growth of nearly all the great inventions and discoveries of the day, most of which have been illustrated and described in its columns. It also contains a WEEKLY OFFICIAL LIST OF ALL THE PATENT CLAIMS, a feature of great value to all Inventors and Patentees. In the

MECHANICAL DEPARTMENT

a full account of all improvements in machinery will be given. Also, practical articles upon the various Tools used in Workshops and Manufactories.

HOUSEHOLD AND FARM IMPLEMENTS;

this latter department being very full and of great value to Farmers and Gardeners; articles embracing every department of Popular Science, which everybody can understand.

STEAM AND MECHANICAL ENGINEERING

will continue to receive careful attention, and all experiments and practical results will be fully recorded.

WOOLEN, COTTON AND OTHER MANUFACTURING INTERESTS will have special attention. Also, Fire-arms, War Implements, Ordnance, War Vessels, Railway Machinery, Mechanics' Tools, Electric, Chemical and Mathematical Apparatus, Wood and Lumber-machines, Hydraulics, Pumps, Water Wheels, etc.

PATENT LAW DECISIONS AND DISCUSSIONS

will, as heretofore, form a prominent feature. Owing to the very large experience of the publishers, Messrs. MUNN & Co., as SOLICITORS OF PATENTS, this department of the paper will possess great interest to PATENTEEs AND INVENTORS.

The Publishers feel warranted in saying that no other journal now published contains an equal amount of useful information while it is their aim to present all subjects in the most popular and attractive manner.

The SCIENTIFIC AMERICAN is published once a week, in convenient form for binding, and each number contains sixteen pages of useful reading matter, illustrated with

NUMEROUS SPLENDID ENGRAVINGS

of all the latest and best inventions of the day. This feature of the journal is worthy of special notice. Every number contains from five to ten original engravings of mechanical inventions, relating to every department of the arts. These engravings are executed by artists specially employed on the paper, and are universally acknowledged to be superior to anything of the kind produced in this country.

TERMS OF SUBSCRIPTION.

Per annum.....\$3 00

Six months..... 1 50

Four months..... 1 00

To clubs of ten or more the subscription price is \$2 50 per annum. This year's number contains several hundred superb engravings, also, reliable practical recipes, useful in every shop and household. Two volumes each year, 416 pages—total, 832 pages. SPECIMEN COPIES SENT FREE. Address,

MUNN & Co., Publishers,

No. 37 Park Row, New York City.

PATENT AGENCY OFFICE.

MESSRS. MUNN & CO. have been engaged in soliciting American and Foreign Patents for the past eighteen years. Inventors who wish to consult with them about the novelty of their inventions are invited to send forward a sketch and description. If they wish to get their applications into Munn & Co.'s hands for prosecution they will please observe the following rules:—

Make a substantial model, not over one foot in size. When finished, put your name upon it, then pack it carefully in a box, upon which mark our address; prepay charges, and forward it by express. Send full description of your invention, either in box with model, or by mail; and at the same time forward \$16, first patent fee and stamp taxes. As soon as practicable after the model and funds reach us we proceed to prepare the drawings, petition, oath and specification, and forward the latter for signature and oath.

Read the following testimonial from the Hon. Joseph Holt, formerly Commissioner of Patents, afterwards Secretary of War, and now Judge Advocate General of the Army of the United States:—

MESSRS. MUNN & CO.:—It affords me much pleasure to bear testimony to the able and efficient manner in which you discharged your duties as Solicitors of Patents, while I had the honor of holding the office of Commissioner. Your business was very large, and you sustained (and I doubt not justly deserved) the reputation of energy, marked ability, and uncompromising fidelity in performing your professional engagements.

Very respectfully, your obedient servant,

J. HOLT.

For further particulars see advertisement inside, or send for Pamphlet of Instruction. Address

MUNN & CO.,
No. 37 Park Row New York City.
