Scientific American.

Evaporative Qualities of Iron, Copper and Brass in Boilers.

In a recent article on page 204, this volume SCIENTIFIC AMERICAN, we presented some very useful information on this subject from the London Mechanics' Magazine. It was stated from a series of experiments conducted by George Tosh, that brassboiler tubes were found to possess an evaporating power exceeding those of iron twenty-five per cent, and that copper tubes exceeded those of brass thirty-one per cent. We observed that the accuracy of the experiments was doubtful, and our doubts we perceive are confirmed by the last issue of the London Artisan, received by us since the article referred to was published. It contains a very good report of the discussion which was elicited by the reading of Mr. Tosh's paper before the Institution of Mechanical Engineers. At that meeting, W. B. Johnson stated that the results obtained by the author of the paper (Mr. Tosh) were very different from his experience, as he had been led to the conclusion that there was no appreciable difference between iron and brass in evaporative power. He had a good opportunity of comparing them on a large scale in "two boilers of 160 horse power each, which had been made exactly alike, excepting that one had iron and the other copper tubes. The result of the working of these boilers was about equal, and no difference could be noticed beween them."

Professor Rankine stated that a series of experiments had been tried a number of years ago, by James R. Napier, with experimental boilers of copper and iron of various thicknesses heated over the same gas flame, and he found but a small difference in their evaporative power, about one-thirtieth being in favor of copper. "In all experiments of the kind," he said, "the state of the heating surface was important, that is, whether smooth or rough, clean or encrusted. The effective evaporating result or transmission of heat through metal depends on three properties-first, the resistance of the first surface (that next the fire) to absorption of the heat; second, the resistance of the internal particles of the metal to the conduction of heat; and thirdly, the resistance of the second surface (that next the water) in giving off the heat. The resistance to internal conduction is less in copper than iron, but its surface resistance is greater. It had been found in experiments very carefully conducted that when the surface became dull, the transmission of heat through all metals was about equal."

Mr. Siemens stated that Dr. Ure had proved by a series of experiments that the conducting power of copper was so good, that by increasing its thickness in a boiler, its evaporative power was not sensibly retarded, while with iron, the result was different-by increasing its thickness, evaporation was greatly retarded. On the other hand, Mr. Roberts stated he had found that the thickness of the metal in a boiler-whether of copper or irongreatly affected the evaporation of the water. The plates, when thick, retarded the passage of heat, and tended to injure the metal by not permitting the caloric to be carried off so rapidly as it should be by the water. He found that brass tubes of No. 18 wire gage, lasted much longer than thicker ones of No. 14 wire gage, under the same conditions precisely. Mr. Craig stated he had not found much difference in practice between brass and iron tubes in locomotives, and did not know of any definite result in favor of one more than the other as to evaporative powers.

Mr. Henry Maudsley stated that in steam engine boilers-particularly marine and stationary-there were other reasons affecting the use of copper or iron beside evaporative qualities or conducting power for heat. Their durability, under exposure to rusting or corrosion, and liability to encrustations being formed in them, were questions of greatimportance. He had known a case of nine marine copper boilers ordered for Naples in preference to iron, because allowance had to without working, and not to suffer from rust, as iron boilers were sometimes under the same conditions seriously injured in eighteen months, while copper boilers were not affected. The original cost and conducting power of boilers, under the same circumstances, were secondary questions to durability.

Mr. Tosh then stated that where he has had charge of locomotives and other engines for several years at Maryport, he had used a great number of brass and iron boiler tubes with apparently equal success, but brass tubes had been generally preferred for locomotives working at a high pressure, because there is less difficulty in keeping them fast in the tube plates, and encrustations are not so liable to form on them as on those of iron; and when iron tubes became leaky in the least degree, their ends were rapidly destroyed, which was not the case exactly with brass. Iron boiler tubes are now extensively employed in England, and many engineers are of opinion that no other kind should be used, but brass is still preferred by the majority.

The foregoing information on this subject -giving the substance of opinions expressed by engineers distinguished in their profession is of much importance, and will interest our readers generally.

Laboratory-No. 2.

Equivalents.—We can no more make progress in chemistry without studying its principles and its laws, than an artist can paint a perfect picture without knowing the rules of perspective; it is for this reason that we have recently turned from the subject of experiments to that of doctrines, especially as we hope that some of our readers will at a future day give us credit for being the finger-post on their road of life which pointed to the path leading to honor. The term "equivalent" in chemistry has much the same meaning as it has in ordinary things. An equivalent means of the same value; thus, twenty shillings in silver (English currency) are equivalent to one sovereign in gold. In the laboratory, the word equivalent implies an atom of matter that is equal to another of a different kind; thus, as we learned in a previous article, that every atom of an element has a specific weight compared with another atom, this weight has, by the consent of philosophers, been denominated its "equivalent." Hence, 28 parts of iron, combining with sulphur, always unite with 16 parts of that fiery element; let the weight of the materials be in grains, ounces, or pounds, the same proportion is always there -in sulphuret of iron. You will say, for the sake of argument, "But suppose we only put 14 parts of iron to 10 parts of sulphur, they will unite." Chemical doctrine says "No," for there will be free sulphur containing no iron; in the mixture, the 14 parts of iron will have combined with 8 of sulphur, which is in the same proportion stated, for as 28: 16: 14: 8. It is thus we call 28 the "equivalent" of iron, and 16 the "equivalent" of sulphur, because we have made hydrogen as the standard of comparison. and have fixed upon 1 as its equivalent, and the base or unit of calculation in measuring the equivalents of all other bodies. A list of equivalents or atoms in weight is given in every elementary work on chemistry; it is, therefore, sufficient for us to point out the road where the philosopher's stone may be

Alloy for Medals, Small Figures, &c.

Herr von Bibra states that an alloy consisting of 6 parts bismuth, 3 tin, and 13 lead, is very fusible, and remarkably hard, without being brittle. The fracture does not present any crystalline appearance. When objects cast with this alloy are moistened with dilute nitric acid, and rubbed with a woolen rag, the raised portions appear bright, and the depressions dull. Some castings of medals from gypsum molds were so perfectly reproduced that writing, which could be read on the originals only by aid of the microscope, was quite distinct in the copies. It is probable be made for their being sometimes laid up that this alloy would be serviceable for typographic purposes. - American Mining Chronicle.

C. D. Seropyan, of New Haven, Conn., has secured a patent in England for a mode of preparing bank notes, bills of exchange and other papers, to prevent counterfeiting by photography and its kindred processes, by using two or more colors, which do not reflect nor transmit, but absorb the chemical rays of light, one of which shall be so applied to the paper as to cover the surface with a tint of a red or a yellow shade of color, while an ink of a different color from the surface tint shall be used for printing the other parts of the note, that is, the obligatory and ornamental parts of the said surface. Where this mode of preparing notes is observed, counterfeiting by photographic or kindred means cannot be effected; for so long as the tint or ground and the vignettes and lettering remain together, a distinct impression of the latter cannot be obtained sufficiently clear and distinct to answer the purpose of the counterfeiter, because both the colors neither transmit nor reflect, but absorb, the chemical rays ght.

Powers, THE Sculptor.—We observe that our distinguished countryman, Powers, has secured another patent in England for a machine for punching, stamping, or cutting metals or other substances, in which the tool can be changed very quickly, and the whole machine can be taken to pieces and re-adjusted with great expedition. Like the singularly and novel formed rasps he invented a few years since, it appears to be simple in construction and admirably adapted to the purposes for which it is designed.

Another American Telegraph.—There is a project on foot at St. Petersburg for establishing a strictly overland telegraphic company with North America. The plan has been presented to the government by a Belgian engineer, and consists in carrying a telegraphic line by Siberia, and to establish a submarine communication between Capes East and Prince of Wales, then to join the lines to those of the United States through the territories of Russia, and England.

THE LEVIATHAN. - Some idea of the immense magnitude of this monster steamer may be formed from the fact that the mere cost of completing her for sea, putting on board stores, &c., and fitting her for the trip she is expected to make to Portland, Maine, the coming summer, will amount to the enormous amount of \$600,000. No less than ten anchors are required to hold her at her present moorings, each with lengths of cable from 40 to 160 fathoms. All her masts are to be stayed by iron rope standing rigging of the most massive kind, the shrouds and stays of which are so secured at their ends through iron rings as to enable a single skilful man to cast loose all the fastenings of each mast in five minutes, in the event of disaster, though until the rings are opened, the sides might yield from the ship before the shrouds would yield.

THE ATLANTIC TELEGRAPH.—Four hundred miles of new cable are in course of manufacture to supply the loss from the failure of the experiment last year, and 300 additional miles which it has been resolved should be provided, so as to allow greater length of slack than was originally contemplated. The cost for these additional 300 miles is estimated at \$180,000. It is generally believed that the plan of joining the cables in mid ocean, instead of starting from either shore, will be resorted to. Considerable modifications are being made in the machinery, and experiare now in progress with making the machinery for paying out as nearly as possible self-acting.

NEW LUBRICATING MATERIAL.-M. Rohrig has discovered a means of removing the acid principles of fat, and thus enabling it to be applied as a lubricator for machinery, without danger of oxydizing the metals with which it comes in contact, besides freeing it from all disagreeable smell and taste, and rendering it to a consistence of castor oil. It hardly colors copper, bronze or brass, does not run like olive oil and other thin oils, and is much cheaper than the ordinary lubricating material.

J. C. R. of Va .- A patent cannot be obtained for any improvement but in the name of the inventor. The apparatus for extracting tannin from bark, described by ou, is not new, and therefore not patentable. Vegetable oils are generally injurious to leather, and so are leather. Tallow and neats-foot oil make a good leather composition. Tooth powders should be avoided, if possible; they are not required if the teeth are, as they

should be, kept clean.

E. B. S., of Iowa.—You will find the artificial ears to which you refer, illustrated on page 67, Vol. XII, Sci.

C. O. R., of N. J .- The fine gloss on shirtbosoms can be produced by a mixture of gumarabic with the starch; but we believe that our city laundresses do it by the quickness with which they iron.

M. F. C., of Iowa .- The friction of your water-tight joints through which D passes, would alone prevent your ever obtaining perpetual motion. Turn your attention to something useful, and do not try to catch

M. A. W., of Ill.—You can precipitate iron from its solutions as sesquioxyd, by adding a solution of carbon-

F. L. W., of S. C .- We could not get up nice engravings of your invention without the aid of a model to take the views from. Engravings taken from the drawings which are attached to the Letters Patent can seldom be made to illustrate an invention in so practical a manner as when the views are taken from the machine or a working model; therefore it is as important to you to furnish good material, to get up your engrav-

ings from, as it is to us.

E. C. M., of N. Y.—Your communications cannot be published. We can fill our columns with matter of more interest to our readers than what you have

P. A. P., of Fla .- A revolving battery intended for the use of war vessels, is not new. If you have anything new in this department it can be patented. Send us a sketch and description of it for examination.

A. H., of Wis.-The employment of a long tube through which to run out the submarine telegraph cable, has been already suggested to us.

J. J., of Ohio.—The "Railway Association" for the encouragement of inventions, to which you refer, is non est inventus. The squaring of the circle means the multiplying of any part of a circle into such a number as will give the exact circumference-without a re-

R. F. B., of Mo .- Your plan of propelling boats by wo direct-acting blades working in tight boxes through the stern of a vessel, is not new, except in being placed on an incline, and being lifted out of the water at each stroke. This is not an advantageous method of operating; they should be placed horizontally.

S. R. Reed., of Buffalo, N. Y., wishes to correspond with the manufacturer of the ditching machine exhibited at the Elmira (N. Y.) Horse Fair last fall. Inbushel must expect to be neglected, or if found at all it must be by some such method of pursuit as is adopted in this case. Such requests as Mr. Reed makes are becoming very numerous.

H. H. F., of Miss.—We are of opinion that your present patent covers the modification of your machine, as represented in the diagram you have sent us.

B. B., of Ohio-Gloves made of stout cotton canvas, boiled in a strong solution of alum, and then dried thoroughly, should last much longer than either leather or india rubber, for handling potash. Several methods for steering vessels have been patented; see Captain Brown's, illustrated on page 268, Vol. 6, Sci. Am.

L. S., of Ind.—Your idea of conveying gas in suitable vessels from place to place, for the purpose of illuminating small villages, is very old. Many years ago a company was formed in London to manufacture illuminating gas, and deliver it to the consumers in bags at their own houses. It was a failure.

J. W. H., of Ind .- Your theory "that there are two funnel-shaped holes running into the earthfrom the poles, through which light and heat enter into it, to disseminate their life-giving properties, and which for forty years you have been maturing," is highly impropable. Mariners and explorers have been very close to both poles, and have not seen anything of the holes; again, the penetrative powers of light and heat have been measured, and we know exactly how they pene-trate the carth. The facts are against you, and true theories can only be formed on known facts. The idea s an old one, having been first promulgated by a Prussian philosopher in the time of Frederick the Great.

L. K., of Pa.-The expansion of hot air is uniform. The pressure increases one pound for every 33 degrees of heat. The pressure is 15 pounds on the square inch, when raised to 490 degrees of temperature.

R. B. N., of Pa.-Your barn being 40X90 feet, should be protected with a lightning rod at each end, which should extend at least ten feet above the summit of the roof, and down several feet into the damp ground, or into a well of water. Unite the sections perfectly together, and fasten the rod to the barn with glass cleets, or brackets of dry wood covered with shellac varnish. The higher and thicker the rod, the more perfect will it be as a lightning conductor.

W. J. S., of ———Messrs. Crum & Paul have a patent for an improved process for making bread, but we are not aware of any patented machinery of theirs for you reside you would have had our answer by mail several days since. There are Newports in almost every State in the Union.

Scientific American.

R. D., of Mich.-Tin being dearer than copper, of course an alloy of these two metals is more expensive than brass made of zinc and copper. Muntz metal for sheathing is composed of 70 per cent of zinc, and 30 of copper. Bronze sheathing may be made with 95 per cent of copper, and 5 of zinc. We have never seen copper coated on one side with tin as thick as the copper sheet. The address of the Waterbury Brass Agency is No. 52 Beekman st., this city.

E. E., of N. Y.—If the circumstances are as you state them, Mr. A. cannot secure a patent on his alleged improvement; but if his invention is new, no influence can possibly avail to prevent the issue of a patent to Every case presented to the Patent Office is judged onits merits, and to attempt to stop a case by "protest," under the circumstances, would be of no avail. You can have an interference declared by making an application for the same device, and if you can sustain your right to it by proof of priority of invention, you can secure the patent-not otherwise.

T. M. P., of N. Y.—To stamp an unpatented article patent right secured," would be a clear violation of the law and punishable by fine.

D. A. B., of Ala.—If your plan for forcing letters through tubes, by means of atmospheric pressure was new, we should have no confidence that it would ever succeed. Similar plans have been tried without suc-

J. B. C., of Ind.—If you own the right in a patented invention for a certain territory, you can make and sell to any and all purchasers upon your own ground. If parties purchasing are willing to run their own risk in attempting to use them upon the territory belonging to another, the responsibility talls upon them, and not up-

F. J. M., of Mass.-When salt water is employed for steam boilers the salt sinks to the bottom—becomes concentrated—it does not rise to the surface; and is removed either by a brine pump or blowing-off. At the Mount Hope Iron Works, where the water is brackish, it must contain the carbonates and sulphates of lime and will, therefore, readily form incrustations. It ought to be purified before being admitted to the boiler; if this is not done, you must blow-off regularly at both the lower and upper blow-off cocks.

T. B. J., of Mass.-We are much obliged to you for your attention in sending us the extracts regarding the Russian steamer Manjoor.

M. M. K., of Texas.-You say that owing to the long drouths of the summer and the ravages of the cuttin; ants, no hedging has yet been tried in your State that answered the purpose, and that by a careful study of the thorn shrubs of your region, you have found one that will stand these unfavorable conditions, and inquire if you can get a patent for it. Surely not. The patent laws have no provisions for the protection of such discoveries. Your State ought to reward you if it

proves permanently valuable.

H. J. H., of Ill.—The philosophy of color is simple. Colors are not substantives, but appearances caused by reflected light, and are no more material than the light itself. When we see a color we know it is produced by a reflected ray of light, just as a shadow is caused by intercepted light; but neither the color nor the shadow are substances.

J. C., of Texas.—Silver or copper are the best metals you can use for electro-plating. You should get "Smee's Electro-Metallurgy," published by Wiley & Halstead, this city. It will give you all the necessary instructions, and you may be able to construct your own bat

S. W. B., of Vt.-There are arrangements of gearing on various machines for communicating a fast or slow motion to machinery. A cone pulley is the most conve nient and common, but not the absolute method.

W. H., of ____.—Your gunpowder engine is new to us. We cannot tell you what would be the cost of it as a power. The sketch which you have sent us representing an endless belt of buckets is not a new water motor, but one that is as old as the genuine water wheel.

D. A. M., of Pa.—The number of the Sci. Am. you wanted has been sent. A millstone of 31/2 feet in diameter will not produce backlash so readily as one of four feet, if the revolutions of the two are equal, no matter what kind of gearing may be employed.

J. D., of N. Y.-Blocks of granite about twelve inches deep, and seven or eight inches wide, set edgewise, are now employed for paving in this city, and have been so used for a hundred years in Europe. There is no necessity for using cement between the interstices, as these assist to give footing to the horses. It makes a very excellent pavement, and your views in this respect are perfectly correct.

P. V. S. of Texas.-We are obliged to reject your article upon "weight and motion;" it is evidently not intended for our readers. Your views are vague and

C. C., Jr., of Mass.—The "first" is the only edition we have seen of Minifie's work on drawing. We do not know the price of pure metal cobalt, but the oxydis sold at the rate of \$1 per ounce

W. H. L., of Wis-We are quite certain that your hopes for a patent are futile, and we must discourage you. When we say that we have had the same thing in our office, we mean it. If you wish to try for a patent you can always depend upon our doing the best we can

for you.
D. A. S., of Wis.—Earthenware cases are among the earliest devices used for burial purposes. We published a number of articles in Vol. 5, Sci. Am., proving the popular notion "that bodies will not sink to the bottom of the ocean at great depths," to be a popular delusion.

account of Patent Office business, for the week ending Saturday, April 3, 1858 :-

W. H. C., of Ill., \$27: J. O., of N. Y., \$305: S. & A. of Mich., \$25; J. C., of N. Y., \$30; J. & J. C. H., of N. Y., \$30; Y., \$30; C. M. L., of Ohio, \$25; G. W. S., of Ind., \$30;

O. S., of N. Y., \$30; R. G. E., of N. Y., \$40; I. Z A. W., of Pa., \$25; L. E., of Mich., \$84; T. H. W. & Bros., of Ga., \$30; L. F., of N. J., \$30; W. W. I., of Conn., \$30; S. T., of _____, \$20; J. W. P., of Pa., \$30; W. & D., of Mass., \$25: W. D. J., of N. Y., \$25; F. B. of N. Y., \$20; F. & J., of Ohio, \$25; S. H., Jr., of Vt., \$10; N. H. S., of III., \$25; N. A., of N. Y., \$25; S. W., of N. J., \$25; D. B. W., of N. Y., \$30; L. T., of N. Y., \$20; H. A. N., of Mass., \$30; W. B., of N.J., \$30; J. C. D., of Ky., \$30; J. C., of N. Y., \$30; B. A. R., of Conn., \$30; J. F. K., of Ind., \$25; G. S. R., of Ohio, \$25; W. C., of N. Y., \$25; I. R. L., of Pa., \$55; C. & B., of N. Y., \$35; W. O. P., of N. Y., \$25; J. T., of N. Y., \$25; T. O., of Miss., \$25.

Specifications and drawings belonging to parties with the following initials have been forwarded to the Patent Office during the week ending Saturday, April

J. C. S., of Mass.; I. Z. A. W., of Pa.; W. C., of N. Y.; C. F., of N. J.; S. & A., of Mich.; J. W. H., of R. I.; C. M. L., of Ohio: W. H. C., of Id.; J. R. L., of Pa.; J. T. B. R., of N. Y.; C. & B., of N. Y.; F. & J., of Ohio; W. & D., of Mass.; W. D. J., of N. Y.; F. B., of N. Y.; W. O. P., of N. Y.; N. H. S., of Dl.; N. A., of N. Y.; S. W., of N. J.; M. G. F., of N. Y.; J. F. K., of Ind.; G. S. R., of Ohio; J. T., of N. Y.; T. O., of Miss.; R. G. E. of N. Y.

IMPORTANT TO INVENTORS.

A MERICAN AND FOREIGN PATENT
A SOLICITORS.—Messrs. MUNN& CO., Proprietors of the Scientific American, continue to procure patents for inventors in the United States and all foreign countries on the most liberal terms. Our experience is of twelve years' standing, and our facilities are unequaled by any other agency in the world. The long experience we have had in preparing specifications and drawings has rendered us perfectly conversant with the mode of doing business at the United States Patent Office, and with most of the inventions which have been patented. Information concerning the patentability of inventions is freelygiven, without charge, on sending a model or drawing and description to this office.

Consultation may be had with the firm, between nine and four o'clock, daily, at their principal office. 128 Fulton street, New York. We have lately established a Branch Agency on the corner of F. and Seventh streets, Washington (opposite the United States Patent Office). This office is under the general superintendence of one of the firm, and is in daily communication with the Principal Office in New York. And per-onal attention will be given at the Patent Office to all such cases as may require it.

We are very extensively engaged in the preparation and securing of patents in the various European countries. For the transaction of this business we have offices at Nos. 66 Chancery Lane, London; 29 Boulevard St Martin, Paris; and 26 Rue des Eperonniers, Brussels. We think we may safely say that three-lowths of all the European patents secured to American diszens are procured through our Agency.

Circulars of information concerning the proper course to be pursued in obtaining patents through our Agency.

Circulars of information concerning the proper course to the patent of the Patent Office, &c., may be had gratis upon application at the principal office or either of the Patents.

Communications and remittances should be addressed to MUNN & COMPANY,

No. 128 Fulton street, New York. A MERICAN AND FOREIGN PATENT SOLICITORS.—Messrs. MUNN & CO., Proprie-

The annexed letter from the late Commissioner of Patents we commend to the perusal of all persons interested in obtaining patents:—

Messks. Munn & Co.—I take pleasure in stating that while I held the office of Commissioner of Patents, MORE THAN ONE-FURTH OF ALL THE BUSINESS OF THE OFFICE came through your hands. I have no doubt that the public confidence thus indicated has been fully deserved, as I have always observed, in all your intercourse with the Office, a marked degree of promptness, skill, and fidelity to the interests of your employers.

Yours, very truly, CHAS. MASON.

TWO LARGE VENEER SAWS—BUILT IN the most thorough manner, and in good running order, will be sold very low. For particulars, address DANA JONES, care of T. C. Kimball, 266-267 West Washington Market, New York.

TURKEY YELPERS A TURKEY CALL OF any own make and pattern can be mailed to any state in the Union by eutcoing \$1 to \$8. SUTHER-LAND, Gundmaker, Richmond, Va.

HORSE CHARMING FOR \$1 IN GOLD-I will send the great horse taming secrets, to I I will send the great horse taming secrets, for which many are paying large sums. No bonds required. Address JOHN M. VENN, Galt, C. W.

THE LIFE OF GEORGE STEPHENSON,
Railway Engineer.—By Samuel Smiles. From
the 4th London Edition. One large handsome 12mo.
volume, with portrait, \$125. "Deep and permanent is
the interest excited by this wondrous story of genius.
No one can read ummoved the early struggles of this
remarkable character, as they are narrated in this
work. To young men faltering, it gives lessons which
should supply fresh vigor. The continuous effort, the
persistent valor, the daring ingenuity, and ever active
intellect of this collier-boy, teaching himself, gradually
making his value felt by all around him, and finally
raising himself to one of the noblest positions in lifethat of a great benefactor to mankind—these must be
studied in the pages of this biography: "Leader. The
above work just published by TICKNOR & FIELDS,
Boston, Mass. Copies sent free of postage on receipt of
price.

THE NATIONAL SEED PLANTER—PATented November 10, 1857, by E. Russell, Coatesville, Chester county, Pa. This new and useful machine will plant the following seeds with accuracy and
despatch:—Corn, (thirty acres per day.) cotton, buckwheat, beans, peas, rye, and sugarcane seed. The following States and Territories for sale or exchange by
Zadoc C. & James S. Cochran: Illinois, Tennessee,
North Carolina, Georgia, Alabama and Missouri; and
the States of May; Jani. South Carolina, Mississippi and
Virginia, by A. D. Harlan, Also the States of Ohio,
Michigan, Wisconsin, Kentucky and Texas, by W. B.
Mendenhall. And the following States: New York,
Iowa, Indiana and Louisiana, 37 H. W. Russell. For
any of the above territory, address the gentlemen as
above-mentioned, at Coatesville, Chester county, Pa.

above-mentioned, at Coatesville, Chester county, Pa.

Machine Shop and Foundry For Sale at Louisville, Ky—With the best stock of engine, pulley and gearing patterns in the city. The Finishing Shop has 12,000 square feets of room, with one large horizontal horing mill of cylinders, two vertical boring mills, turns6% and 8 feets, one double-headed lathe, 3f feet bed, swings 30 inches, seven small slide lathes, turns 8 to 12 feet, one planer, 12 by 3 feet square, one compound planer with circular attachment, three wood-turning lathes, three drill presses, one gear cutter, bolt cutter, vises, and a large assortment of small tools to expedite work. Foundry has 3500 feet molding floor, with every facility. Blacksmith Shop has six forges, with requisite tools for a jobbing shop. Buildings are of brick, and none over five years old. Having made a conditional sale of the justicus and flasks, will sell the buildings and any portion of the tools, separately or together. Parties who might wish to engage in the same business, or convert it into an agricultural machine shop, can seldom meet with such an opportunity to get a bargain. Apply to or address, E. A. GARDNER, assignee of LAWSON & PEARCE.

NEW SAW-GUMMING MACHINE, FOR Re-toothing Circular and Mili Saws, &c.—This machine, as represented in our catalogue, is entirely of wrought and cast iron; it is of sufficient power to retooth with ease the thickest and largest saw made. Our catalogue gives a further description, and will be forwarded on application.

R. HOE & CO.,

29 and 31 Gold st., New York.

L ATHE CHUCKS-WE WOULD CALL THE attriction of machinists to a Geared Screw Chuck we are manufacturing, which is warranted to be superior to any in use We are also building a Car Wheel Chuck, which can be fitted true to any sized face plate or boring table with ease. For list of sizes, testimonial, cuts, &c., address E. HORTON & SON, Windsor Locks, Conn.

FOR SAILE—RIGHTS IN TWO PATENTS FOR Steam Engine improvements, being a valuable variable cut-off, and practical direct connection of piston rods with crank, effecting great saving in construction and fuel. Interests given to capitalists. Inquire of B. ACKERMANN, 710 Broadway, New York.

FIRE-ARM CHALLENGE—MR. GILBERT SMITH'S conditions are accepted. He is likely to be my only opponent among the host of breechloaders in this country, (Sharp's Co. and Colt alse.) and his change of ground from simple accuracy to combined accuracy and endurance, are accepted, and \$300 staked. Within 300 shots (merely to save time and labor) my challenge is open to the 22d of April, 1588, to any aspiring inventor of breech-loaders. No respect will be paid to firing for rapidity.

J. C. SYMMES, 1st Lieut. U. S. Ordnance, March 31, 1888. Watertown Arsenal, Mass.

CLOCKS—TOWN CLOCKS OF ALL SIZES.

Regulators and Timephones for all purposes. Dials for illuminating. VOSBURGH & CO., Age: 14, No. 28 Liberty street, New York. JOHN SHERRY, Manufacturer, Sag Harbor, N. Y.

CORLISS? PATENT STEAM ENGINES—
are now in operation On application, pamphlets will be sent (by mail), containing statements of responsible manufacturing companies where these engines have been furnished, for the eaving of fuel, in periods varying from 2% to 5 years. Boilers, shafting, and gearing.

CORLISS STEAM ENGINE CO.

Providence, R. I.

CHURCH AND REGULATOR CLOCKS, models, engravers' ruling machines that work themselves, and light work done at low prices, at J. STOKELL'S Clock Factory, No. 26 Platt street, New York.

OIL! OIL! OIL!—FOR RAILROADS, STEAM DERS, and for machinery and burning. Pease's Improved Machinery and Burning Oil will save fity per cent., and will not gum. This oil possesses qualities vitally essential for lubricating and burning, and found in no other oil. It is offered to the public upon the most reliable, thorough and practical test. Our most skillful engineers and machinists pronounce it superior and cheaper than any other, and the only oil that is in all cases reliable and will not gum. The Scientific American, after several tests, pronounced it "suberior to any other they have ever used for machinery." For sale only by the inventor and manufacturer, F.S. PEASE, 61 Mainst., Buffulo, N.Y. N.B.—Reliable orders filled for any part of the United States and Europe.

VAIL'S SPEEDWELL IRON WORKS, Morristown, N. J., manufacture Craig's Patent Double-acting Balance Verlve Oscillating Steam Engines both stationary and portable, Knowles Patent Muley, Portable, Gang and Re-sawing Mills, Sugar and Chinese Cane Mills and Sugar Pans, Grist Mills, Mill Irons, Rich's Water-wheels, Forgings and Castings.
