

**IMPROVED REFRIGERATOR.**

When life, either animal or vegetable, has departed from organized beings, the elements of which they are composed are forced asunder by the action of heat, and the rapidity of the decomposition depends upon the degree of heat to which they are exposed. If placed in a furnace of burning coal, a few hours at most suffices to dissipate the elements and scatter them abroad into the atmosphere; but at a temperature below the freezing point of water, organisms may be preserved—like the frozen elephants which are found among the icebergs of

**BAKER'S IMPROVED REFRIGERATOR.**

Siberia—for thousands of years, and perhaps for hundreds of thousands. This general law of the rapidity of decomposition depending upon the degree of the temperature, has forced itself upon the notice of people in many of the operations of life, and hence the very general practice of retarding the decay of meats and vegetables by keeping them in a cool place. In cities, the usual mode of cooling a refrigerator is to place a piece of ice in it, but in many parts of the country this luxury is not to be had, and its place has been partially supplied by a plan of cooling by evaporation. The annexed engraving illustrates one of the latest inventions of a refrigerator of this class.

The interior surface, *a*, of the box, *A*, is made of slate or other good conducting material, surrounded by an outer wall, *b*, of wood or other slow conductor of heat, with an air space, *c*, between the two walls. The outer wall has grooves both in its exterior and interior surfaces, with holes connecting the grooves for the circulation of the air. The whole is covered with a canvas, *B*, which is kept constantly wet by water dripping upon it through holes in the reservoir, *C*; a dish, *D*, being provided to catch the waste in case the supply should be excessive. By means of the handles, *E*, the box may be lifted out of the dish, in order to obtain access to the contents which are kept on the shelves, *F F*, supported by the frame work, *G*. The canvas being kept wet and, a constant circulation of air being maintained on both its surfaces, a rapid evaporation is produced which, by the conversion of sensible into latent heat, reduces the temperature of the refrigerator.

The patent for this invention was secured through the Scientific American Patent Agency, April 3, 1860, and further information in relation to it may be obtained by addressing the inventor, W. M. Baker, at Walpole, Ind.

**TUSCH'S SOAPING AND SCRUBBING BRUSH.**

It is frequently remarked—and with much truth—that patents for simple contrivances prove, in the majority of instances, more profitable than inventions of a complicated character, where much time, labor and capital are required in introducing them. In proof of this assertion, the accompanying engravings exhibit an invention

of a strikingly-simple yet ingenious character, and one which will doubtless prove as profitable to its designer as it is useful to the public; it is a brush of peculiar construction, which will obviously recommend itself to the approbation of all lovers of cleanliness—the virtue which is said to be “next to godliness.” Brushes are divisible into three classes, according as they are used for removing dirt, polishing surfaces, or applying colors; the invention here illustrated appertains to the first of these classes, and it consists in a mode of attaching a cake of soap to the back of a brush in such a manner that, after

its attachment, the cause of its adhesion is invisible, although it (the soap) is held perfectly secure during every manipulation of the brush in all kinds of washing and scrubbing operations, until it is completely used up.

Fig. 1 is a perspective view of an ordinary long-handled flesh-brush; to its back, *a a'*, there is attached a metal plate, *b*, which is secured by rivets or any other convenient fastening; the lateral edges of this plate are turned up and over, so as to form a curved groove, as shown at *c c*; and against the sharp extremities of these edges the lower portion of one end of a cake of soap (shown by the dotted outline, *g*) is pushed in a horizontal direction, with a slight downward pressure. The soap thus becomes incorporated with the brush, as effectually as if the two articles were made of the same mate-

rial. Instead of the curved groove above shown, the edges of the plate may be abruptly turned up at an acute angle in relation to the back of the brush, so as to form an angular or dovetailed groove, which will be found equally as useful as the curved one; and instead of having one broad plate, two narrow and suitably-bent strips of metal may be applied, one at each side of the brush. Fig. 2 is an end view of the same brush, showing the depth to which the edges of the plate penetrate the soap. Beneath the brush represented in Fig. 1, there is shown a nail-brush having the described device attached to it.

The patent for this invention was secured, through the Scientific American Patent Agency, on May 22, 1860, and further information in relation to it may be obtained by addressing the inventor, Wm. Tusch, Brooklyn, N. Y.

**SIXTEENTH YEAR!!!**

On the 1st of July next, the **THIRD VOLUME** of the “**NEW SERIES**” of the **SCIENTIFIC AMERICAN** will be commenced.

In announcing the above fact, the publishers embrace the opportunity to thank their old patrons and subscribers for the very liberal support they have hitherto extended to this journal; placing it, as they have, far beyond that of any other publication of the kind in the world, in point of circulation. The average circulation of the **SCIENTIFIC AMERICAN** during the past year has been—

**30,000 COPIES PER WEEK!**

Some editions have reached as high as 60,000; none less than 26,000. The extent of the circulation evinces the popularity of the paper; and while our readers seem satisfied with the quantity and quality of matter they get in one year's numbers (comprising 832 pages and costing only \$2), the publishers are determined to still improve the paper during the coming year.

The **SCIENTIFIC AMERICAN** has the reputation, at home and abroad, of being the best weekly publication devoted to mechanical and industrial pursuits now published, and the publishers are determined (if labor and enterprise will do it) to keep up the reputation they have earned during the **FIFTEEN YEARS** they have been connected with its publication.

**THE INVENTOR!**

The **SCIENTIFIC AMERICAN** is indispensable to every inventor, as it not only contains illustrated descriptions of nearly all the best inventions as they come out, but each number contains an official list of the claims of all the patents issued from the United States Patent Office during the week previous; thus giving a correct history of the progress of inventions in this country. We are also receiving, every week, the best scientific journals of Great Britain, France and Germany; thus placing in our possession all that is transpiring in mechanical science and art in those old countries. We shall continue to transfer to our columns, copious extracts from these journals of whatever we may deem of interest to our readers.

**TO THE MECHANIC AND MACHINIST!**

No person engaged in any of the mechanical pursuits should think of “doing without” the **SCIENTIFIC AMERICAN**. It costs but four cents per week; every number contains from six to ten engravings of new machines and inventions, which cannot be found in any other publication. It is an established rule of the publishers to insert none but original engravings, and those of the first class in the art, drawn and engraved by experienced persons under their own supervision.

**TO THE CHEMIST AND ARCHITECT!**

Chemists and architects will find the **SCIENTIFIC AMERICAN** a useful journal to them. All the new discoveries in the science of chemistry are eliminated in its columns, and the interests of the architect and carpenter are not overlooked; but all the new inventions and discoveries appertaining to these pursuits are published from week to week.

**TO THE MILLWRIGHT AND MILL-OWNER!**

Useful and practical information appertaining to the interests of millwrights and mill-owners will be found published in the **SCIENTIFIC AMERICAN**, which information they cannot possibly obtain from any other source. To this class the paper is specially recommended.

**TO THE PLANTER AND FARMER!**

Subjects in which planters and farmers are interested will be found discussed in the **SCIENTIFIC AMERICAN**; most of the improvements in agricultural implements being illustrated in its columns.

**TO THE MAN-OF-LEISURE AND THE MAN-OF-SCIENCE!**

Individuals of both these classes cannot fail to be interested in the **SCIENTIFIC AMERICAN**, which contains the latest intelligence on all subjects appertaining to the arts and sciences, both practical and theoretical; all the latest discoveries and phenomena which come to our knowledge being early recorded therein.

**TO ALL WHO CAN READ!**

Everyone who can read the English language, we believe, will be benefited by subscribing for the **SCIENTIFIC AMERICAN**, and receiving its weekly visits; and while we depend upon all our old patrons renewing their own subscriptions, we would ask each to send us one or more new names with his own. A single person has sent us as many as 160 mail subscribers, from one place, in a single year! The publishers do not expect every one will do as much; but if the 7,500 subscribers, whose subscriptions expire with the present volume, will send each a single name with their own, they will confer a lasting obligation upon us, and they will be rewarded for it in the improvement we shall be enabled to make in the paper by thus increasing our receipts. The following are the—

**TERMS.**

To mail subscribers: Two Dollars a Year, or One Dollar for Six Months. One Dollar pays for one complete volume of 416 pages; two volumes comprise one year. The volumes commence on the first of **JANUARY** and **JULY**.

**CLUB RATES.**

Five Copies, for Six Months.....	\$4
Ten Copies, for Six Months.....	\$8
Ten Copies, for Twelve Months.....	\$15
Fifteen Copies, for Twelve Months.....	\$22
Twenty Copies, for Twelve Months.....	\$28

For all clubs of Twenty and over, the yearly subscription is only \$1 40. Names can be sent in at different times and from different Post-offices. Specimen copies will be sent gratis to any part of the country.

Southern, Western and Canadian money or Post-office stamps taken at par for subscriptions. Canadian subscribers will please to remit twenty-six cents extra on each year's subscription to pre-pay postage.
