ILLINOIS AND ST. LOUIS BRIDGE COMPANY---REPORT OF CAPT, JAMES B. EADS, CHIEF ENGINEER

The St. Louis bridge, and the great suspension bridge over greatest engineering works of the kind now in progress in this country, if not in the world. Both are demonstrating the value of the caisson as an appliance for constructing heavy abutments, the successful overcoming of which will estabengineers of the age.

This gentleman has forwarded to us advance sheets of his to present in the present brief review, and in future extracts, as full as our page space will permit, the more important facts and statements of interest.

The masonry of the west abutment has been carried up from the bed rock of the river to 31 feet above low water. It now contains 6,380 cubic yards of masonry. When completed cient precautions being taken to prevent accident. The air in it will be 115 feet high above the bed rock, and will contain the cylinder should have been completely expelled or dis-11,860 cubic yards.

Greater difficulties were encountered in the construction of the river at this point had been made the receptacle of every kind of useless material, old sheet-iron, furnace grate-bars, another column.

No accident occurred in sinking it, and it reached and rested the accident occurred is composed of engineers of established upon the bed rock on the 28th February, 1870. The bed-rock reputation. under this pier is 128 feet below high-water mark. During low water, the depth of sand resting on the bed rock at the site of this pier is 80 feet, at high water it scours down some-

During the sinking of the caisson, the walls at one time sprung a leak, so that the men had to be signaled up. This occurred during extraordinarily high water, and work was suspended till the water subsided.

office of the Superintendent of construction, and also to the credit the common theory, that wells of this character can be great success of that nation. Fifty years ago the German naoffice of the Chief Engineer. The moral effect of the knowledge obtained anywhere by boring deep enough in the earth's tion was overrun by foreign troops, their villages were burned, stantly at hand, is said to have been very salutary on the by several writers. workmen in the air chamber. mon-sense style from beginning to end. It is too full of facts since, in an address relating to "The American Desert," ocfor condensation, and we should be glad had we space to publicupying the country between the base of the Rocky Mounlish it in full, instead of confining ourselves to extracts.

EXPLOSIONS FROM HYDRAULIC PRESSURE.

The very limited compressibility of water and its consequent limited expansion when released from pressure, have led most people to believe that in making hydraulic tests, or in urging the cylinders of hydrostatic presses to their utmost power of endurance, no danger is to be apprehended from exinders would so relieve the pressure that its force would instantaneously be reduced far below that of any expanding gas, and, therefore, that the bursting of a press cylinder could result in nothing more serious than the cost of repairing the damage to the machine.

That this fact does not secure immunity from accident is proved by a casualty which occurred during the testing of a ment is scientific administration. cylinder in Manchester, England, resulting in the death of the man who was performing the test.

The cylinder, which was of steel, was subjected to a pressure of 7,000 lbs. per square inch. It burst under this pressure, and killing the person above alluded to.

At the inquest Mr. Ommaney one of the firm owning the velocity imparted to the fragments, to the elasticity of the

Had the material of which the cylinder was composed been cast iron, the pieces of iron would have been forced out, and have flowed out in the usual way, as in a similar case which the damage done was wholly due to the elasticity of the steel, which would be greatly expanded by the water, and when the bolts were displaced it would, as a natural consequence, contract so suddenly as to send the water out with a tremenwhether there was any air left in the cylinder when it was filled, but all the witnesses agreed that such precautions had been taken as to make this absolutely impossible.

A writer in a Manchester paper discussing this accident maintains that the cylinder must have contained air, and such East River, between New York and Brooklyn, are the two is our opinion. The elasticity of the cylinder does not, to our mind, afford a satisfactory explanation of the accident. The any other apparatus) as that now under consideration, by peculiar difficulties, resulting from the great depth of the fastenings giving way or the metal of the cylinder being ruptured; while, on the other hand, should the vessel contain greater, since the confined air in virtue of its elastic force bereport, dated October 1, 1870, from which we shall endeavor circumstances. The public have read enough of late about boiler explosions to realize the danger attending the use of sufficiently strong to withstand such a pressure, and yet few can believe that in the case before us a similar force, but extance." ceeding 7,000lb. per square inch, was applied without suffiplaced by the water before the pressure was applied. Had this been done there would have been no explosion, though this pier than in either of the others, owing to the fact that the bolts should be too weak to stand the heavy strain upon them. The ram was "hurled a distance of 10 or 12 yards, while the cylinder recoiled about 7ft." Now this is all that fire-bricks, etc., and two wrecks of vessels had also been sunk any practical man requires to know in order to explain the on the site of the abutment. More particular mention of cause of the accident; and yet, strange to say, the inquest these will be found in an extract from the report printed in passed without a single ray of light being thrown on the matter. The danger of allowing air to remain in the cylinder The caisson for the east pier was launched October 18, 1869, during a test has been well recognized, yet it seems that in and on the 25th of October, the first stone was laid upon it. this case it was overlooked, though the firm in whose works

> The accuracy of the gage used on the occasion is also questioned, and there is little doubt that the gages employed are often so inaccurate as to be their indications of high pressures.

This territory, he said, embraced an area of 400,000 square miles; and that "all this tract needed to make it one of the most productive portions of the continent, was water, which, in his opinion, could be readily furnished by artesian wells and other modern methods of irrigation."

Before emigration sets in to that section of country, it will be necessary to test the question whether a subterranean supply of water exists in it, which will rise to the surface. plosions. It is reasoned that the smallest rupture of the cyl- The experiment of the Government exploring party, a few years since, in boring for water, proved a failure, though conducted under the direction of a geologist.

SCIENTIFIC ADMINISTRATION.

The great want in the conduct of the affairs of our Govern-

The number of men who have been appointed to office in the United States at any time during the last thirty years on account of any fitness for the positions is lamentably small. The question of fitness is discarded at once, and political confragments of the metal flying off with great force, wounding siderations are made to outweigh knowledge. So common has it become to appoint men notoriously ignorant of the first principles of government or of political economy, that an eduworks in which the accident occurred, assigned the destructive cation is looked upon as a defect in a man's training for political promotion and the number of persons who think it worth while to seek a liberal education is actually less at the present time than it was thirty years ago, although the population has vastly increased. It is in view of this startling simply have dropped on to the floor, and the water would statement of facts that many of our most enlightened citizens have formed a social science association for the discussion of occurred at their works some time ago. He considered that the best way of remedying the evil. They call loudly for a reform in the civil service, and demand that appointments shall be made after competitive examinations and on grounds of fitness, rather than of political affinities.

It will probably require years to break up the present sysdous force. During the inquest a question was mooted as to tem, but that it ought to be destroyed, no man of intelligence will hesitate to affirm. But it is not alone in the administra tion of the affairs of the Government that a reform is needed, We could point out quite as urgent a necessity for a radical change in the conduct of private business, as can be found in the more conspicuous mistakes of office-holders. There are many large manufacturing establishments where scientific knowledge is sadly wanting. When we see "Positively no writer referred to argues that in testing such a cylinder (or admittance" over the door, we conclude that somebody is afraid to have his ignorance exposed. Wise men know that masonry under water. The former, however, is attended with means of water pressure, no danger would arise from the the chances are altogether in favor of the workmen in every establishment gaining quite as much knowledge from casual visitors as they can themselves impart. We have heard a lish the fame of Capt. Eads as one of the most accomplished air, or partly water and air, then the danger is infinitely scientific friend relate how he was denied admission to an establishment in this city where the success of the works dehaves just as steam of equal pressure would under similar pended upon accurate knowledge, on the plea that the processes employed were secret. Subsequent inquiry revealed the fact that no one of any scientific knowledge was employed steam of, say, 50lb. to 100lb., when generated in vessels not | on the premises, and the fear of having this omission divulged to the stockholders was the occasion of the "No admit-

> Professor Liebig tells a story about a chemical factory he visited in Scotland. The proprietor politely showed the eminent chemist through an establishment for making Prussian blue. The noise of the machinery was so great as to preclude conversation, and the iron scrapers in a revolving mill rubbed so hard against the sides of the hopper as to wear out the shafting in a few months. After the party had returned to the open air, Liebig inquired why it was that the friction was allowed to destroy the scrapers.

"That is precisely the secret of my success," said the proprietor; "I find the more noise the machine makes, the finer is the quality of my product."

The manufacturer actually introduced iron into the prussiate of potash at the expense of his machinery, and he was not a little astonished when Liebig advised him to throw in the iron in the form of scraps and thus accomplish the same results.

This is a fair illustration of the way many capitalists have of avoiding the expense of employing scientific experts—they prefer to grind up their own machinery to asking a few questions for which they will be compelled to pay.

It is impossible to get on in the government, in the shop, Some of our readers will remember the article of Professor in the factory, in the camp, or on the farm without scientific ern times can deny this fact. The whole world is reading tions. They were helpless and divided in council, and wholly In addition to the facts then presented, Professor Christy unprepared for the shock. As soon as the notes of war ceased and the smoke had cleared from the political horizon, the leading statesman of the day began to inquire into the cause pressure upon the health of the workmen. Capt. Eads' obser | Asylum at that city. The boring extended to a depth of of the humiliating condition of affairs. The great minister, vations on this point are so valuable that we shall publish 3,8431 feet without success. No water flows from it at the Von Stein, the Bismark of those days, was not slow to detect them in full in a future issue. Suffice it for the present to surface. The attempt has been a failure, and it has been 'the utter want of scientific administration in all of the affairs say that though twelve deaths occurred, one half the men abandoned. Thus the views of Prof. Christy, step by step, of State as well as in the management of trades and manuconstantly employed from the beginning to the end of the are being sustained. A year previous to the work being dis-factures. His remedy was thorough and complete—his recontinued upon the boring at the State House, Columbus, forms laid the foundation of the future grandeur of the Ger-
