more vegetation than all other animals, including mankind, the sunshine. This variation cannot certainly be attributed oxidized, until the coat of oxide presents such a resistance to do; yet such is undoubtedly the case; and man finds that al- to differences in the temperature of the air at the points further action that the two metals are put on a par, and no though he can cope with any of these insects individually, where the thermometers hang, since there is free and rapid current is atterwards produced. The lead of the other flask, their vast numbers render them formidable enough to often render famine imminent.

But if we remember that not one of these races of insects exists which is not food for some other insect, bird, or animal, we have the clew to the remedy for their ravages. Keep the power of the eaters and the eaten properly, balanced, and their mischief will cease to terrify.

### SARATOGA SPRINGS.

This popular summer resort seems to have lost none of its prestige, judging from the crowds of people who have visited it during the present season. Its hotels are filled, its numerous springs still flow abundantly, and their waters are eagerly sought for by those who are sick, or imagine themselves so, and those who, being well, desire to remain so.

In our recent visit to this watering-place, although we must confess its attractions are many, and its hotels conducted in model style, we were led to entertain some doubts as to whether more benefit than harm is derived from the profuse and indiscriminate drinking of the water by visitors who are accustomed to hear of the generous rivalry that moted thereby. Neither of these facts apply to the there lead pipe. In reference to the danger of leaving water in goes on respecting the virtues of the various springs. The celebrated Congress Spring, though declared to be weak in comparison to former years, still maintains its supremacy, and this famous water can be purchased in London, Paris, Calcutta, and Hong Kong. The Empire Spring sends forth a clear, delicious, and healing water, superior in its medicinal effects upon some diseases to the Congress. The new "Hathorn" is a fine spring, recently discovered, and is already very popular. Since the last year this water has cleared up, and no longer irritates the intestines of its habitual drinkers. The "High Rock," the "Star," and the "Excelsior" are also excellent springs, and deserve to be noticed favorably.

But the greatest natural curiosity among them is what is called the "Geyser" Spring, discovered last winter by the proprietor of a bolt factory directly underneath the center of the building. Noticing traces of mineral water at this point, he caused a boring to be made to the depth of 150 feet, where he struck water in a stratum of bird'seye limestone. This remarkable stream spouts intermittently but rapidly to a hight of twenty feet into the building which has been transformed into a bottling establishment.

particularly rich in mineraling redients. It contains chloride | pose of sodium, chloride of potassium, bromide of sodium, iodide of sodium, fluoride of calcium, bicarbonate of lithia, bicarbonate of soda, bicarbonate of magnesia, bicarbonate of lime, bicarbonate of strontia, bicarbonate of baryta, bicarbonate of ent of the temperature for anything more than the immediate of iron, and sulphate of potassa, with traces of phosphate of vicinity of the instrument. We very much doubt that in any soda, biborate of soda, alumina, and silica. The water is agreeable to the taste of those who like it. It is a powerful cathartic in its action, and the spring is considered one of the when shielded not only from the sun's rays but from the of the dry powder. When required for use it is necessary to best ever discovered. It takes a long time, however, to obtain a widely extended popularity for any of these springs; hence the waters are always freely given to those who will come THE ACTION OF WATER ON LEAD, TIN, AND COPPER. for them. Yet, although the waters are free to all comers, he that hath no money, though invited to come, will find no rooms at Saratoga. The hotels are crammed with visitors, and private houses are called into requisition to hold such as the hotels cannot accommodate, the prices visitors are willing to pay being such as to tempt people in moderate circumstances to accept the inconvenience for the sake of gain.

But to go back to the use of the waters by old and young, sick and well, alike. At the mineral springs in various parts of Europe the waters are generally taken under the direction of physicians. In this country few of the frequentors of such places act under advice, but proceed to swill down the waters of first one spring and then of another without regard to quantity or quality or adaptability to their physical condition, apparently going it blind in the hope of being benefited before they get away.

Now this is entirely wrong, these waters are strong solutions of mineral salts, of greater or less therapeutic power, and it is just as rash and senseless to drink them in this manner. as it would be to rush into an apothecary's shop and, shunning all the violently active poisons, to go the rounds of his bottles and jars, taking a sip from one and a pinch from another, without regard to their probable effect.

An instance in point occurred while we were at Saratoga this season. An old gentleman, afflicted with a heart disease, drank in rapid succession some ten or a dozen glasses of the

the air itself.

A common error in regard to thermometers may be mentioned here. It is thought by many that when air is blown perature. This notion grows out of the fact that the body feels cooler in a breeze than in still air. The latter result is due solely to the facts that the power of air to convey heat ; gratifying to have these experiments confirmed, as a good from a body hotter than itself is increased by free circulation, and that evaporation, the great cooler, is also greatly promometer, since the mercury in the bulb of that instrument, if properly placed, is of the same temperature as the air, and mind of any person. And this danger is greatly increased by no evaporation, under ordinary circumstances, takes place the presence of nitrates and chlorides in the water. Lead is therefrom. But wet the bulb with water even a degree or a subtile poison, and too much care cannot be taken to pretwo higher in temperature than the mercury; the result will vent its presence in water that is required for domestic use. be that after an instant or so the mercury will commence falling, and will mark a lower temperature than that of the air in which it stands. The effect will be still more remarkable if ammonia or ether be used instead of water.

thermometer when the bulb is wet. But when the bulb is dry, a precisely reverse effect is produced, although much less in degree. Tyndall shows, in his lectures on heat, that the friction of even the gentlest zephyr upon a fixed body generates a perceptible amount of heat therein. Therefore if air at rest causes a given expansion in the mercury column, when in motion it will cause an increased expansion from the heat generated by friction. Of course this increase is very small. In fact it is less than can be perceived upon the column itself, and can only be determined by the most refined An analysis by Professor Chandler shows this water to be more it cannot be less, which is sufficient for our present pur-

> When we hear of the thermometer standing at one hundred in the shade at any point north of Philadelphia we are always inclined to doubt that the indication is a fair exponlocality on the continent north of the fortieth parallel the thermometer ever indicated one hundred degrees in open air radiation of surrounding bodies.

the alkali of the West, and thus to bring it into solution by Mr. Paul Casamajor, an accomplished chemist in the sugar which the metal would settle and the liquid quartz could be refinery of Messrs. Havemeyer & Co., has been making some converted into building stone or employed for any other puroriginal experiments upon this vexed question which we find pose for which it is adapted. The quantities to be dealt with published in the American Chemist, and the importance of the subject leads us to make an abstract of the results of his reto have stood in the way of the practical application of this searches. The presence of lead in Croton water, after standmethod, but theoretically it was perfectly feasible. ing in the lead pipes for the night, has been incontestably It would not be easy to detail all of the uses to which solushown by Professor Chandler. Mr. Casamajor also proves ble glass has been applied, but it may not be out of place to that it is often present in the tin-lined boilers, and accounts recapitulate some of them : 'To protect wood from the action ; for its presence there by the voltaic action resulting from the of water, air, and fire; in fresco paintings on walls; to repair | contact of the lead in the lining, or in the connecting pipes stone buildings; to make artificial stone; for cementing with the copper of the boiler. To prove this he took pieces broken glass; to make hydraulic cement; to protect metals of lead and copper and put them in contact in two flasks which he left in the dark at the temperatures of 75° Fah. and from rust; as a solvent for corallin; to mix with mineral colors : as a solvent for various substances : as a lubricator : 150° Fah., for forty hours. In both instances the surface of to preserve the elasticity of leather bands on machinery; for the lead was corroded, and that metal was found to be in sopainting on paper hangings and calicoes; to give glass the lution in the water. It therefore becomes a serious question appearance of enamel; as a detergent; as a reagent in the what influence the imperfect lining of boilers may exert. It laboratory ; to impregnate petroleum barrels, beer casks, butis essent al that so much lead is used in their construction. ter tubs, and milk pails, so as to render them tight; for glazinstead of block tin, that every one of them is a galvanic bating clay pots as a substitute for lead ; and the manufacture of tery, producing more or less lead poisoning. This fact has of artificial gems. Its chief value is in the restoration of been overlooked, and while many families have taken the stone buildings, in fresco painting, and to render fabrics unprecaution to remove all lead pipes, they have forgotten to inflammable. As a means of preserving iron from rust, and inquire into the composition of the kitchen boiler. On this as an external application to wooden buildings, it has been point Mr. Casamajor remarks : "These results leave no doubt attended with so many failures as to throw doubt upon its on the hurtful effect of exposing drinking water to the simul "Washington" spring water, the tonic power of which is taneous action of both lead and copper. The effect of an unpractical value for these purposes. Its usefulness on leather belting we also deem extremely doubtful, although it has been recently asserted to keep such belts soft. It is an artion the hot, as all the lead pipes are in communication with cle that ought to be manufactured on a large scale and more the copper boilers by metallic conductors. Whether an ungenerally used. tinned copper boiler may not even have an injurious effect on the water of a neighboring house is an inquiry before which WHO DISCOVERED NITRO-GLYCERIN. we must pause." The next point to be examined was how far lead and tin It is somewhat remarkable that the date of the discovery of react upon each other when placed in contact in water at  $75^\circ$ and 150° Fah. To ascertain this he instituted experiments cribed to Professor Williamson (1853), and again to M. Nobel, similar to those previously described. "At the end of twenty-four hours the flasks were examined the Swedish engineer who has done so much towards making The above expression, with the numeral adjective changed and replaced in the dark. The lead in contact with tin was its properties known; and to the late Professor Pelouze is according to circumstances, is very commonly met with, and slightly tarnished, while that of the other flask (tin in water also given the credit. In the transactions of the Turin Acadalone) remained perfectly bright. At the end of six days the emy of Sciences for July 5, 1847, may be found a memoir on tarnish of the lead in contact with tin persisted, but did not fulminates, and the action of nitric acid on certain organic The indefinite character of the phrase creeps in at the last seem to have increased. This is apparently due to this circompounds, by Professor A. Sobreso. In this paper the aucumstance, that a voltaic couple of tin and lead in aqueduct thor gives an account of long and dangerous researches made water is very weak, tin being slightly more positive than by him on this subject.

circulation throughout the entire building. Directly opposite which had now been in water for over a week, was as bright the room where the writer now sits is a large brick building, as when first put in the water." Mr. Casamajor was unable against which the sun shines during the afternoon. The to detect the least trace of lead in the flask where the lead or radiation of heat from this building is such that the ther- tin had been left in contact. And his experiments would mometer will sometimes stand several degrees higher with seem to throw great doubts upon the assertions frequently made that tin and lead mutually act upon each other and It is evident, therefore, that if the exact temperature of the poison the water. A great objection to tin-incased lead pipe air be sought, it is not enough to place a thermometer out of and tin-lined lead pipe has been that in places where there the sun. It should be placed in a total heat shadow where it, was a fracture or where the surfaces came in contact under may be read by reflected or diffused light, but be protected, water a voltaic current was produced and some of the lead as nearly as may be, from the effect of all heat except that of was carried into solution. Mr. Casamajor's experiments do not confirm this theory, but, on the contrary, he could find no lead whatever, although he put the metals in the most favorable conditions for accomplishing the reaction, if any could over the bulb of a thermometer it will indicate a lower tembe expected. Lead and copper in contact under water at once react upon each other, but lead and tin appear to be neutral after the formation of the first coating. It would be deal of disquieting doubt has been cast upon the security that was supposed to be offered by the tin-lined and tin-incased contact with lead alone there appears to be no doubt in the

## THE USES OF SOLUBLE GLASS.

Although liquid quartz, or soluble glass has been known for more than fifty years it does not, even at the present day, This experiment illustrates the effect of wind upon the have half the applications in the arts of which it is capable, It was accidentally discovered by Prof. Fuchs, of Munich, while engaged in searching for a method by which to prepare pure silicic acid, and was afterwards very thoroughly studied by him, and all of its properties made known.

It is a very simple thing to make either in the dry or the wet way, and the choice of the methods depends upon the quantity to be prepared. Pulverized flint stones or quartz pebbles, or fine sand, can be dissolved in a solution of caustic soda or potash, when boiled under a pressure of 7 or 8 atmospheres. Infusorial earth or Tripoli is also admirably methods. The fact remains, however, that if there be adapted for this purpose. In the dry way it is usual to fuse 45 pounds of quartz, 30 pounds of potash, and 3 pounds of charcoal powder; or 45 pounds of quartz, 23 pounds of calcined soda, and 3 pounds of charcoal.

For certain purposes it is also customary to make a glass of soda and potash combined. This mass fuses easily, and is readily soluble in hot water. As the solution absorbs carbonic acid from the air it must be kept well sealed.

Soluble glass is sold in liquid form of a given strength, usually 33 degrees, meaning 67 parts of water and 33 parts dilute it, as the above concentration is too strong for most purposes.

There was at one time a proposition to boil gold quartz in -the great amounts of soda required for the operation-appear

well known. His circulation was so accelerated thereby that tinned copper boiler must be felt on the cold water as well as his heart could not endure the increase of labor demanded, and he fell dead upon the piazza of the hotel.

We have no doubt that, while these waters are of immense value, as remedies tor general debility, and various forms of disease, many are injured rather than benefited by their use, simply because they use them without proper discrimination, which can only be obtained through competent medical advice.

# NINETY DEGREES IN THE SHADE.

yet as giving anything but an approximate index to the real temperature of the air it is of little value.

word. Ask almost anybody what they mean by "in the shade," and they will tell you " out of the sunshine."

nitro-glycerin should be a matter of dispute after all that has been published on the subject. The honor is sometimes as-
