#### For the Scientific American. Animal Mechanism.

At the knee where the motion is backwards and forwards in the same plane, there is a hinge, mortice and tenon joint, more accurately is it most beautifully and skilfully adapted, time. but the limbs can be extended in a different they have thrown their limbs on a horizontal line with the plane of their bodies.

In machinery we use oil and other lubricating material and construct anti-friction wheels to make shafts and other pieces of mechanism run with ease and smoothness, but the Great Mechanic has furnished our bodies with a supply of the most refined lubricating material for our joints and applied it by a most masterly contrivance. To our joints there is sup $plied\ regularly$  a mucillage more slippery than oil which wonderfully diminishes the effect of attrition. For this purpose glands are fixed near each joint for feeding the cavities with this distilled mucillage, and the glands hanging like loose fringes within the cavities the oil is continually oozing out from them to lessen the friction. Friction wheels in machinery are made in imitation of this but the animal manifests a decided superiority over the merely artificially mechanical. The fine polish on the surface of the bones which compose our joints cannot be equalled by the most skilful artist, and the lubricating material which is continually dropped into them is supplied in proportion to the amount required as the ducts give out the mucillage as they pressed, more or less, by the action of the joints. It would be wellfor every mechanic to study Anatomy, at least the great outlines of the science. From a study of the arrangement of the different parts of the animal economy, many surgeons have become the most skilful and ingenious mechanics. Dr. Anderson, the inventor of the Flying Artillery, was one of the most ingenious of mechanics, and there is not a single surgeon but is very skilful, in facthas to be, and neatin constructing and arranging various machines.

## PHYSICIAN.

## Trituration Phenomena.

If any coarse and dry substance is triturated by itself, it will continue to be permanently divided and subdivided to a certain but limit- are about six hundred feet high, and extended extent-for beyond that, the blow would ed eight miles in length. The depth to either leave the parts so near each other that | which the color penetrated has been variousthey would instantly reunite by the power of the cohesive forces and again become one solid body, or would drive these newly separated parts against others or each other, and spread beyond one or two inches. effect their union by bringing them within the sphere of cohesion. This principle is illustrated by the example of the flint stone,if pulverized in a mortar, it would at length [Humboldt certainly mentions a shower of red become so fine that some of the finest of these invisible flint stones would, after any farther division, be soon reunited. All that would be necessary for their reunion and the restoration of their previous hardness would be to bring the parts or their mutually attractive poles so near as to touch each other as before their separation, for the strength of their cohesion depends on the degree of their proximity .--The approximation and union of some of these smaller than microscopic pebbles would be it as it revelled on a sprig of myrtle; and promoted by the pressure of the pestle ; the | now grew sure of his prize on perceiving it same blows that severed some would unite others-so that the average size of the parts would remain unchanged.-Dr. Joslin.

[It is a well known fact, which we have experienced frequently, that after having pounded some hard substance in a mortar until it was so fine that no grit could be felt when pressed between the fingers, that a heavy blow with the pestle would make this fine | lowing words: substance become perfectly hard, just as Dr. Joslin has represented. Indigo for example, is a good substance to test the truth of this statement.

Insects are found in slate and flies in amber. |perish in thy grasp."

Velocity. The velocity of motion is estimated by the time employed in moving over a certain space or by the space moved over in a certain time.

The less the time and the greater the space Dr. Keill has computed the magnitude of a person of such a mind stands and gazes at a defined by the Great Architect than any that passed over in that time, the greater is the comes out of the hands of the most ingenious velocity. Thus the space and time being givcarpenter. At the hip there is a mortice and en, to find the velocity divide the space by its web, the spider has a most curious spintenon joint of a peculiar form. There is a the time. The time and velocity being given, ning machine. It consists of four little knobs socket and a ball so that not only for walking to find the space multiply the velocity by the

Moun- with the instantaneous motion of light ena- sand in each of these four divisions, a space tebanks have skilfully availed themselves of bles us to determine the distance of the object itself not bigger than the point of a pin. the adaptedness of this joint to this purpose, from which the sound proceeds; as that of a From every one of the holes a thread proceeds and have made whole theatres to stare at their cannon fired at a distance, or a thunder cloud, so that the very finest part of a web which wonderful agility and suppleness, whereby provided we can see the flash and hear the report. Multiply 1130 by the number of seconds between the flash and report-the pro- maker would call them. duct will be the distance in feet. Divide the number of seconds by 4.5, and the quotient

will be the miles, nearly. ry or spirits of wine, moves 4900 feet in a second; conveyed by tin, 7800; by silver, 9300; nute that many thousands taken together, are by brass, 11, S00; by copper, 12,000; by iron less than the point of a needle. A grain of or glass, 17,500, and by wood, from 11,000 to musk will fill a large room with a very be a small thing, invested completely with a 12,000 feet in a second. According to the strong scent, without losing a millionth part little cloth, he expands his being in a grand experiments of Sauveur, the lowest sound of its weight. Whence it is calculated that a which the ear can appreciate consists of  $12\frac{1}{2}$ 

# something more than 6000.

### Color of Snow.

depend very much, if not entirely upon the arrangement of their particles by which they reflect this or that kind of rays of light. Some experiments of Dr. Brewster of Edinburgh, prove this. He took a piece of polished steel and by beating it to a different degree of temperature, different colors are exhibited and by making slight cuts on its surface, some of them curved or waved &c., he also was enabled to exhibit different colors in consequence of the light being reflected at different angles and of course different rays striking the eye. In regard to the color of snow, we believe that in our latitude it is of a brilliant white color. But in higher latitudes it has been seen of a red color. This at first astonished Parry and his companions, who discovered it in the arctic regions. After a close examination it Wus found that the red color was occasioned by a foreign substance mingled with it, and which, on further examination, was found to be a very minute vegetable, something like some of the mosses or mould. Indeed, it might with propriety be said to be mouldy snow.

Capt. Parry observes that the arctic mountains, on which he observed the red snow, ly stated by different observers. Some found that it descended many feet beneath the surface, while others never ascertained that it

There is no reason to suppose says he, that the coloring matter itself as well as the snow, is a meteorlogical product, althongh hail which fell at Paramo, in South America.

## A Beautiful Moral.

A boy, on perceiving a butterfly, was so smitten with its gaudy colors, that he pursued it from flower to flower with indefatigable zeal ; at first he attempted to surprise it among the leaves of a rose; then he endeavored to cover it with his hat, as it was feeding on a daisy; now he hoped to secure to loiter on a bed of violets; but the fickle butterfly still eluded his attempts. At last, was discovered inside containing a live catter- much fatigued, were soon sound asleep, they observing it half buried in the cup of a tulip rushed forward, and snatching at the object of his pursuit with violence, it was crushed <sup>1</sup> to pieces. The dying insect perceiving the boy chagrined at his disappointment, addressed him with the utmost calmness in the fol- of the earth. The shell and the remains of

"Behold now the end of thy unprofitable solicitude, and learn for the benefit of thy future life, that pleasure like a painted but-

divided, either by actual separation of its par- ture with one's being so as to have a percepticles, or by some imaginary dividing time ; tion, a life, and an agency in all things. A particle of assafectida, to be only 3S trillionths tree for instance, till the object becomes all of a cubic inch. For the purpose of forming wonderful, and is transfigured into something or spinners, enclosed by a ring and pierced with a multitude of holes, so numerous and so extremely fine, that there are above a thouwe can see is not a single line, but a cord, composed of four thousand strands as a rope-

Divisibility.

Wool may be spun so fine that a quantity weighing only one grain may be divided into eighty thousand parts each visible to the na-Sound conveyed by means of water, mercu- ked eye. Certain microscopic animals have motion, In sunshine or soft showers, it carbeen discovered in various substances so misingle grain is actually divisible into more undulations in a second, and the most acute of than six trillionths of parts. A grain of gold he stood on yonder distant mountain top, concan be beaten so thin and spread so large as to admit of being divided into fifty millions of It has been found that the colors of bodies parts, each of which may be distinctly seen with the help of a microscope.

## Excavations in Pompeii.

The political state of Italy has lately been engrossing so much attention, that little time has been found for its antiouarian Since the discovery of the 47 gold coins, and 250 silver coins, together with gemmed ear-rings a dwelling house has been excavated near della Fortuna, which surpasses in richness and elegance all that has before been discovered. The open vestibule, is paved with mosaics, and the walls decorated with tasteful paintings. The Atrium opens into the tablinum and the reception room. and the latter leads into the dining room, which is painted with mythological subjects the size of life; Here were several triclinic couches, not unlike our modern sofas, richly ornamented with silver. The reception room looks into a garden with a beautiful fountain, adorned with numerous mosaics, and a small statue of Silenus; the basin is surrounded with the most exqusite sculptures in marble. Adjoining the dwelling is another four wheeled carriage, with iron wheels and many bronze ornaments. In the kitchen also are ornaments and utensils of bronze, and the traces of smoke are visible in many places, after the lapse of 18 centuries. The apartments of the dwelling house contained numerous elegant utensils of gold and silver, vases, candelabra, bronze coins, several cases of surgical instruments, &c. What is extremely rare is, that there is a second and even a third story, which are ascended by a wide flight of stairs. On a small painting near the staircase is the name and rank of the owner, in scarcely legible characters! and from which it appears that he was one of the Decuri, or Senators of Pompeii. All the walls and the rooms are ornamented with comic and tragic paintings, one of which represents a young girl with a matk and a flagolet. Hence the house has received the name of casa della Sonatrice, or casa del 'Ercole ubbrucio.

#### Extraordinary.

new colliery at Northup, near Hawarden, Flintshire, Eng, brought up a piece of solid following expedient was adopted :-- 'Two It happened to get broken when a shell coal. pillar. We understand that this extraordinary reptile remained alive for two days after it was rescued from the prison in which it had been confined from the time when the coal was overwhelmed and buried in the bowels the catterpillar have been sent to the museum of the King's College, London. There have been numerous instances of frogs and toads beig buried alive in the midst of solid terfly, may serve to amuse thee in the pursuit rocks, but this is the only instance that we but if embraced with too much ardor, will remember of a catterpillar having been found alive in such a tomb.

The Power of Imagination.

Divisibility renders a body capable of being Physiopathy is a faculty of pervading all navisionary and ideal. He is amazed what a tree is, how it could, from a little stem, which a worm might crop. rise up into a majestic size, and how it could ramify into such multitudinous extent of boughs, twigs, and leaves. Fancy climbs up from its root like ivy, and twines round and round it, and extends to its remotest roots shoots and trembling foliage. But this is not all; the tree soon becomes to your imagination a conscious being, and looks at you, and communes with you; ideas cluster on each branch, meanings emanate from every twig. Its tallness and size look conscious majesty, roaring in the wind, its movements express tremendous eries a gay, a tender or a pensive character; it frowns in winter in a gloomy day. If you observe a man of this order; though his body circle around him. He feels as if he grew in the grass, and flowers, and groves; as if versing with the clouds, or sublimely sporting among their imagined precipices, caverns and ruins. He flows in that river, chafes in its cascade, smiles in its aqueous flowers, frisks with the fishes. He is sympathetic with every bird, and seems to feel the sentiment that prompts the song of each. This is, in one sense ' inheriting all good things.'

## Temperature of the Ocean.

According to Captain Ross's experiments, the zone of mean temperature lies between the parallels of 54 degrees, and 60 degrees of south latitude, not only at the surface, but to as great a depth as the ocean has ever been penetrated, Future trials will in all probability reduce it to narrower limits; its position in the northern hemisphere remains yet to be ascertained. This mean temperature is met with both in the polar circles and in proceeding towards the Equator. In the higher latitudes above 10 degrees, the ocean in descending increases in temperature until it arrives at its mean point; while proceeding towards the Equator it decreases from the surface downward-this decrease, beyond the tropical circle, is about twentythree fathoms for every degree of latitude, within the tropics it is 1 degree for every thirteen fathoms of depth, until 400 fathoms, after which it requires a descent of from 200 to 409 fathoms to effect a like change.

From the observations of Admiral D'Urville it would appear that the waters of the Mediterranean do not follow the rate of descent of the Atlantic and Pacific Oceans. He estimated the mean temperature of that sea below 200 fathoms, at 65 degrees, and this from the fact of having obtained that temperature at the depth of 1,000 fathoms. If this be so, it leads to an interesting inquiry whether this may not be in consequence of the vast internal fires that are known to prevail in the countries that surround it.

#### Economy.

At the recent Railroad celebration in New Hampshire, a large number who remained in Lebanon, were sadly puzzled to find accomodations over night. A worthy inhabitatant of that place, declares that such was the Recently, the men employed in opening a |rush, thai, in one instance, there was but one bed for fifty persons! In this dilemma, the persons took possession of the bed, and being were then carefully removed, and set up against the wall. This process was repeated till the whole fifty were disposed of."

#### A Deep Crime.

If there is one crime more deep than anoth er, it lies at the door of him who corrupts the morals of another perhaps a young and confiding friend. He is sowing, broad-cast seeds that may devour the constitution, and destroy the happiness of millions yet unborn, The doom of such cannot fall short of the " blackness of darkness" forever and ever.
