Chemistry applied to the Arts.

In dyeing certain colors, it is necessary that a large proportion of oxygen should be united with the cloth to be dyed, before applying the coloring matter; and many complicated processes have been invented by different dyers with a view of condensing the greatest proportion possible.

The old process of bleaching consisted in exposing the yarn or cloth to air and light, and sprinkling the cloth occasionally with water. In this process the light promotes the union of the oxygen of the air with the coloring matter of the cloth, or rather with the elements of the coloring matter-carbon and hydrogen ferming with them carbonic acid and water. A long time would be occupied in converting the whole of the coloring matter of the cloth into carbonic acid and water; to shorten the process, the cloth is sprinkled with water from time to time, which carries off the partly decomposed coloring matter, and leave a fresh surface to be acted upon by theair. This process is, however, much too slow for the manufacturer of the present day, who always uses chlorine in bleaching cloth, calico, &c.

Oxygen has a great tendency to unite with most metals to form oxides, or rust; it is, therefore, of great importance that we should be able to prevent this union totally, or in part; the object to be attained is to prevent the contact of oxygen and the metal-this is accomplished in various manners under different circumstances. By coating the metal with paint, we prevent its rusting—the color in the paint is not acted upon, that being already united, where metallic paints are employed, with as much oxygen as it will take up; still, as the oil and turpentine in the paint, both become decomposed in time by uniting with oxygen, the paint requires to be rene ved occasionally. Paint cannot, however, be employed to protect metal that is exposed to heat. Blacklead (carbonate of iron) is better adapted to protect metals exposed to a heat, not too intense, such as stoves, engine boilers, &c. All metals, however, do not require to be painted in order to preserve them the surface of the metal being insoluble under ordinary circumstances, and impervious to air, serves to protect it completely from all turther corrosion.

Most explosive compounds owe their rapid combustion to the fact that they contain a substance, readily decomposed, yielding oxygen sufficient for the combustion of the other ingredients forming the compound, which are all capable of uniting with oxygen, and forming gaseous compounds,—for the force of the explosion depends upon this sudden conversion of solid matters into gases. There are gases.

Iee.

Ice, when converted into water, absorbs and combines with 149 degrees of caloric. Water, then, after being cooled down to 33 ble. It is hence that nearly the whole of Eudegrees, cannot treeze until it has parted with 150 degrees of caloric: and ice, after being heated to 32 deg., which is the exact Sinard mentions, at the commencement of the freezing point, cannot melt till it has absorb- last century, that then six hundred and thirty ed 140 degrees more of caloric. This is the cause of the extreme slowness of the operation. There can be no doubt, then, that water owes its fluidity to its latent caloric, and that its caloric of fluidity, is 140 degrees. However long we may boil water in an open vessel, we cannot make it the smallest degree who can be happy only by peace, madly arm hotter than its boiling point, or 212 degrees. themselves for their misery, and fight for the When arrived at this point, the vapor ab- accomplishment of their ruin; and when the sorbs the heat and carries it off as fast as it is din of war is ended, they behold the earth generated. Hence in cooking, we attain the lying in desolation, the arts buried, and their general heat at the boiling point, though by real power annihilated. Between England increasing the fire, we increase the evaporation. Owing to the quantity of caloric that course of seven hundred years, there have liquids require to convert them into vapor, all evaporation produces cold. An animal millions of lives. might be frozen to death in the midst of summer, by repeatedly sprinkling ether upon, off the whole of his vital heat.

Ancient Metals.

Of the use of these, the Scriptures make very early mention. In the days of Moses, gold is spoken of as put, and sometimes kept could be made to touch the handle. Then be symptoms of madness, the medicine must sword to be cooled in the usual way, snatch- sion; but if actual symptoms of madness ly, thus to temper steel, but without success. A woman should take less of the beer than a Scott gives a description of the swords of man, say about 3 or 3 and a half gills-for Richard, which cut down steel with the same children the medicine must be regulated acfacility. The cannons of the British in In- cording to their age and constitution. It must | combed by the dampness of the dew, and | more of it than grown persons in proportion to be totally useless in war. The lines of to their age. Byron, on the rust upon the steel of the warriors, are according to truth, though that should take an extra portion; if the child warrior had lain but one night beneath the would receive one or two spoonsful of the open sky. Necessity has been to the East; medicine it would be sufficient. A horse Indian, the mother of invention. He will should be given one pint; a cow 20 spoonsful, take the cast off hoop of an English cask, and a heifer or dog, according to age, size and make of it a sword equal to the best Parisian strength—the medicine to be taken warm and blade. The pliability of the steel of the an- well shaken-it must be taken in the morncients was wonderful, but that of their bronze ing, and fast must not be broken for three or was more so.

The Nitre Lakes in Egypt.

What a singular scene! In the midst of this sandy waste, where uniformity is rarely spoon victuals, particularly of milk or warm interrupted by grass or shrubs, there are ex- beer. A beast must not be watered on that tensive districts where nitre springs rise from day; and a person must, for two weeks abfrom the destructive effects of oxygen, for this the earth like crystalized fruits. One thinks stain from the following catables, viz: Meat reason :- the first coat of oxide formed on he sees a wild waste overgrown with moss, and pork of all kinds, cabbage, peas, beans, weeds and shrubs thickly covered with hoar frost. And to imagine this wintry scene, be- the skin, the wound must be scratched with neath the fervid heat of an Egyptian sun, will a chip until it bleeds and washed with some give some idea of the strangeness of its aspect. The existence of this nitre upon the sandy surface is caused by the evaporation of make a plaster of the threriaca venti (venice the lakes. According to the quantity of nitre left behind do these fantastic shapes assume either a dazzling white color, or are more or less tinted with the sombre hue of the sand. The nitre lakes themselves, six in number, situated in a spacious valley between two rows of low sand hills, present a pleasing contrast worn except perfectly clean. All straw that a certain explosive compounds which contain in their dark blue and red color, to the dull beast has lain on must be burnt and the stable no oxygen; the explosion in this case de-1 hues of the sand. The nitre, which forms a cleansed. pending entirely on the facility with which thick crystalized crust upon these shallow solid or liquid substance is resolved into its lakes, is broken off in large square plates, the wound is made, to cup the lacerated simple elements, which, in most instances, are which are either of a dirty white, or of a flesh color, or a dark deep red. The Fellahs employed upon this labor stand quite naked in tumbler can be used as a substitute by exthe water, furnished with iron rods. The part which is removed being speedily renewed, the riches of its produce are inexhaustirope is exclusively supplied with natre; and this has probably been the case for ages, for thousand weight of nitre was annually broken for the Grand Seignor, to whom it yielded thirty six purses.

War.

Men, who can do nothing but by union, and France, those two kingdoms alone, in the been 266 desolating wars, and the loss of

Amongst the things which the Germans have conquered by their Revolution, is "the him. The evaporation would shortly carry right to smoke in the streets." Boston has taken pattern.

Receipts for the Cure of Hydropachia.

Take of the red chick-weed (herba anageiis ruber) that has been dried, one handful dia, it is well known, soon became honey- be likewise observed that children can bear

The mother or person that nurses the child four hours after taking it. No cold or fresh water must be taken, otherwise serious consequences might arise. On the day of taking the medicine, the person must abstain from fish or water fowls. If a person is bit through of the decoction; this may be done for two or three days. If the wound requires dressing, treacle) twice a day until the wound is healed. Observe, that before dressing, the wound must be clean washed, with the decoction After having made use of the medicine, the person must put on clean linen and change all his clothes and bedding, which must not be

Another receipt for its cure is, as soon as parts. In case no physician 18 at hand, or inability to procure a set of cups, an ordinary hausting the air in the glass with a piece of lighted paper. The cupping process cannot fail to draw the virus from the system.

Bathing with the chloride of lime is also good.

As Good as a Yankee Trick.

A New Yorker in Vermont, being "dead broke" and wishing to reach Hudson, gave a fellow his jacket, to start the report there that he was Mosher, the anti-renter, for whom a reward has been offered by Gov. Young. The trick took, a Vermont constable arrested the broken werchant, and took him nothing loath to Hudson. When he reached that place instead of pocketing the one thousand dollars he was surprised to find that he had got the wrong man, who gave not the least intimation that he intended to return to the constable, the cost of passage to Hudson.

Seidlitz Powders.

Each dose contains 25 grains of tartaric acid in the white paper, and 30 grains of supercarbonate of soda, mixed with two drachms of glauber salts in the blue.

Add a little sugar and a few drops of the essence of lemon to the above, and it will three thousand one hundred and ninety-six make good lemonade.

To Preserve Strawberries.

Strawberries for preserving should be large and ripe. They will keep best if gathered in pour two quarts of good beer on it, and boil dry weather, when there has been no rain for in a liquid state, while it is beyond our power it in a new earthen pot (the pot must be cov- at least two days. Having picked them all, to reduce it to a powder. The corners of the ered with a close lid until half the liquor boils select the largest and firmest, and spread them stones of the pyramids are so sharp as to away,) it must be boiled over a slow fire, the out separately on flat dishes; having first break the skin of the hand when passed over vessel in which it is boiled must be kept very weighed them, and allowed to each pound of them, and so hard as to resist the sharpest clean, and used for no other purpose. When strawberries a pound of powdered loaf sugar. steel. The French found great difficulty in the herb is boiled enough, it must be strained Sift half the loaf sugar over them. Then take carving two lines upon the obelisk now in through a clean cloth and well squeezed, so the inferior strawberries that were left, and La Place Concorde; yet the ancients had co- that the substance may be all taken out of it, those that are over ripe, mix them with an vered all the facades with figures. Accord- than add to the decoction two drachms of the equal quantity of sugar, and mash them. Put ing to history, they had an art, now lost, of best Threriaca Venti, it must be well dissolthem into a basin covered with a plate, and making copper, (one of the softest of all met- ved and mixed with the decoction. Of the set them over a fire in a pan of boiling water, als) harder than steel, and it was of this they above decoction give to a man or beast in the till they become a thick juice; then strain made their tools. The famous Delhi Blades, morning, fasting, the following proportions. it through a bag and mix with it the other as it is well known, are unrivalled. They A man of strong constitution must take a pint half of the sugar that you have allotted to the would cut off the heads of a row of bob nails of it, and that at one time if possible, if not strawberries, which are to be done whole. placed one after another without dulling their at once, take it at short intervals, but if ta- Put it into a porcelain kettle and boil and skim edge; and were yet so pliable that the point ken at one draught it is best. If there should it till the scum ceases to rise; then put in the whole strawberries with the sugar in which the warrior, too impatient to wait for his be taken two or three mornings in success they have been lying, and all the juice that may have exuded from them. Set them over ed it red hot, and waving it in the air, thus should exist, a larger portion of the herbs the fire in the syrup, just long enough to heat gave it its temper. They tried in Paris late- should be added to the said quantity of beer, them a little; and in a few minutes take them out, one by one, with a teaspoon, and spread them on dishes to cool; not allowing them to touch each other. Then take off what scum may arise from the additional sugar. Repeat this several times, taking out the strawberries and cooling them till they become quite clear. They must not be allowed to boil; and if they seem likely to break, they should be instantly and finally taken from the fire .-When quite cold, put them with the syrup into tumblers, or into white queensware pots, and cover close with fine paper.

Preserving Currants.

Currants and gooseberries may be preserved all the year round, as fresh and sweet as when taken from the bush. The fruit should be plucked while green, or before the berries assume the red color, which precedes and heralds maturity, and put into clean dry glass bottles, which should be corked and sealed tight, and placed in the cellar, or some other cool place, an ice house would be the

To Preserve Cherries.

Take large ripe morella cherries; weigh them, and to each pound allow a pound of loaf sugar. Stone the cherries, (opening them with a sharp quill,) and save the juice that comes from them in the process. As you stone them, throw them into a pan or tureen, and strew about half the sugar over them, and let them lie in it an hour or two after they are all stoned Then put them into a preserving kettle with the remainder of the sugar, and boil and skim them till the fruit is clear and syrup thick.

Cabbage and Greens.

All the capbage tribe which includes cauliflower, brocoli, coleworts, sprouts, and turnip tops, in order to be delicate, should be dressed young, when they have a rapid growth but if they have stood the summer, they require the influence of the frost to become tender. In order to appear green at table, they must be boiled in hard water. Greens of the above description when of advanced growth, are better flavored when boiled in two waters, which is managed in the following manner. After they have been about half boiled, take them out of the pot, place them in the colander, and allow water to run on them for two or three minutes; then replace them in a fresh pot of boiling water, with some salt, and let them continue to boil briskly till done, Cauliflower should boil more slowly, as it is apt to be broken by the force of a violent ebullition. Brocolt, to be freed from its offensive odor, should be boiled

Gropher Bunt.

A litttle animal called the "gropher" is very troublesome to the farmers in the Western States, throwing up mounds to the height of from twelve to fifteen inches. They are peculiarly destructive in corn fields. A few days since, the inhabitants of Porter, Wisconsin, had a hunt for the purpose of annihilating all the grophers in that vicinity. Forty men went to work, and succeeded in killing grophers.
