#### Copying by Casting.

The Art of Casting, by pouring substances in a fluid state into a mould which retains them until they become solid, is essentially an Art of Copying. It also happens that the thing produced resembles entirely, as to shape, the pattern from which it was formed.

made from drawings are the originals from which the moulds for Casting are made, so that, in fact, the Casting itself is the Copy of wooden pattern. In castings of iron and same places there are now standing trees ot for the coarser purposes, and, if they are afterwards to be worked, even for the finer machines, the exact resemblance amongst the things produced which takes place in many mass of copper that will weigh from eight to of the Arts to which we have alluded, does ten tons. This mass was buried in ashes, and not happen, nor is this necessary. As the it appears they could not handle it, and had metals shrink in cooling, the pattern is made no means of cutting it, and probably built larger than the intended copy; and in extrica- fire to melt or separate the rock from it, ting it from the sand in which it is moulded, which might be done by heating, and then some little difference will occur in the size ot the cavity which it leaves.

the mould, and plaster is the substance which and may be of great benefit to some. We is almost always employed in the cases now under consideration. The property which it for some time yet, as it is but a short time possesses of remaining for a short time in a to this purpose, and adhesion is effectually found considerable silver during the past the transparent stone known by the name of prevented by oiling the surface on which it is poured. The mould formed round the original, removed in separate pieces and then reunited, is that in which the Copy is cast.

Casting in wax is a mode of Copying, Natural History, and gives an air of reality to a planet in our system. them which might deceive even the most instructed. Numerous figures of remarkable persons, having the face and hands formed in wax, have been exhibited at various times, and the resemblances have in some instances been most striking. But whoever would see the Art of Copying in wax carried to the highest perfection, should examine the beautiful collection of fruit at the House of the Horticultural Society, London; the model of the magnificent flower of the plant which forms the new genus Rafflesia; or the waxen models of the interials of the human body which adorn the Anatomical Gallery of the Jardin des Plantes, and the Museum at Florence.

The Art of imitation by wax does not usually afford the multitude of Copies which flow is checked by the subsequent stages of the process, which, ceasing to have the character each individual production.

An act of parliament, in such subject hoarfrost. Indeed, a petrified pond looks like matter, is studiously written, and expects to frozen water, and, before the operation is be diligently read, and it generally comprises quite finished, a stone slightly thrown upon it stomach. Medical aid was immediately called, from many similar operations. This number compositions of the multiplex character which breaks the outer coating, and causes the black has been described. It is a kind of writing, water underneath to exude. Where the operatherefore, to which some species of rhythonical of Copying by a tool or pattern, consequently movement is indispensable, as any one will and a man may walk on it without wetting become more expensive Form alone is find who attempts to draft a difficult and com- his shoes. given by Casting; the colouring must be the prehensive exactment, with the omission of all Wherever the petrifaction has been hewn work of the pencil, guided by the artist in the words which speak to the ear only, and into, the curious progress of the concretion is are superfluous to the sense. Let me not be clearly seen, and shows itself like sheets of misunderstood as presuming to find fault rough paper placed one over the other in Mr Knapp, of the Vulcan Mining Company generally and indiscriminately with our accumulated layers. Such is the constant of Lake Superior has lately made some very modern manner of writing. It may be adapted tendency of this water to become stone, that singular discoveries in working one of the to its age and its purposes; which purposes, as where it exudes from the ground in bubbles, veins, which he lately found He worked bearing directly upon living multitudes, have the petrifaction assumes a globular shape, as into an old cave which had been excavated a vastness and momentuousness of their own. if the bubbles of a spring, by a stroke of magic, centuries ago. This led them to look for All that it concerns me to aver is, that the had been arrested in their play, and metamorother works of the same sort, and they have purpose which it will not answer is that of phosed into marble.

exultation, each to its appropriate music, and these again contrasted with the steady statements of the doxologies. Let us listen, I say, to this language, which is one effusion of celestial harmonies, and compare with it the flat and uninspired tones and flagging movements of those compounds of petition and exhortation (from their length and multifariousness peculiarly demanding rhythmic support), which are to be found in modern collections of prayers for the use of families. I think the comparison will constrain us to acknowledge that short sentences in long succession, however clear in construction and correct in grammar, if they have no rhythmic impulsethough they may very well deliver themselves of what the writer thinks and means-will fail to bear in upon the mind any adequate impression of what he feels-his hopes and fears, his joy, his gratitude, his compunction, his anguish, and tribulation; or, indeed, any assurance that he had not merely framed a document of piety, in which he had carefully set down whatever was most proper to be said on the mornings and evenings of each day. These compositions have been, by an illustrious soldier, designated "fancy prayers," and this epithet may be suitable to them in so far as they make no account of authority and prescription; but neither to the fancy nor to the imagination do they appeal through any utterance which can charm the ear .- Henry Taylor.

## Petrifaction Ponds.

The following is a description of the petrifaction pones at Shirameen, (a village near the lake of Ourmia in Persia,) which produce Tabriz Marble. - This natural curiosity conmonly called Tabriz Marble, which is so re- can capitalists and mechanics of this city and which forms a chief ornament in all buil- ing furnace in the Brazilian province of Rio dings of note throughout the country. #### Coal.

Mineral coal dug from the earth is organized carbon buried in ancient reeds and forests by the sinking down of the crust of the planet at particular points, and the washing in of earthly sediments above the submerged forest, to be consolidated into stratified or sedimentary rocks. The prodigious force of volcanic power, acting from below, upheaves all these strata, their cracks and wide fissures are washed into valleys by the ceaseless action of rain, frost, electricity, light, heat, and other meteoric influences; and thus they wear down solid rocks to coal beds, and often far below them.

Carbon is the coal which may be obtained alike from wood, straw, grain, flesh, and almost, if not quite every truly organized product of life. There is carbon enough in the carbonic acid which is chemically combined with lime in limestone rock, to cover the whole globe with a pure diamond 500 feet in thickness. While an immense quantity of carbonic acid is discharged into the atmosphere from volcanoes and internal heat, acting like fire on limestone in a burning kiln, by which 100 lbs. of rock lose 44 lbs. of gas; yet old ocean keeps up nature's great balance, by absorbing an equal quantity of carbonic acid gas to combine with the store of the earthy minerals below.

## Brazll.

In the Empire of Brazil in which abounds the finest Iron Ore, there is not a single smelt ing furnace, notwithstanding the very consi derable incursion that French and English sists of certain extraordinary pools or plashes, Capitalists have made there. There are se-

## Danger of a Cent.

On the 17th day of September, 1847, a lad 7 years of age, son of Mr. Theodore P. Bowker of Boston, accidentally swallowed a copper cent, which lodged at the entrance of his and although the physicians could distinctly feel it with their instruments, all efforts to extricate it were unavailing. The lad suffered great inconvenience in consequence of its remaining where it first lodged, and has frequently abstained from eating his regular meals, such was the distress occasioned by food coming in contact with the piece of conper. Thus the matter continued until the evening of the 17th inst. a period of ten months, when he was suddenly seized with a violent vomiting, and among other matter, threw up the atoresaid cent, which was covered with a thin firm scaly substance.—The little fellow is now as healthy as ever, and feels greatly relieved at having disgorged the indigestible
