## The Great sait Desert

Perhaps the most remarkablefeature of th great West, is the vast Salt Desert, which lies nearly in the centre of the Continent. The frequent allusions to it in the Western News induces us to give the following account of it, which we find in Bryan's journal of a tour through California.
We stood on the brow of a deep precipice the descent from the ridge of hills immediate ly below and beyond which a narrow valley or depression in the surface of the plain, abou five miles in width, displayed so perfectly the wavy and frothy ap pearance of highly agitated water, that Colonel Russell and myself, who were riding together some distance in advance buth simultaneously exclaimed: "We must have taken a wrong course, and struck anoth er arm or bay of the Great Salt Lake." With deep concern we were looking around survey ing the face of the country to ascertain wha remedy there might be for this formidable ob struction to our progress, when the remain der of our party came up. The difficulty was presented to them; but soon, upon a more calm and scrutinising inspection, we disco. yered that what represented so perfectly the "rushing waters" was moveless and made no sound! The illusion soon became manifes ous all, and a hearty laugh at those who were the first to be deceived was the conse quence; denying to them the merit of being ood pilots or pioneers, \&c.
Descending the precipitous elevation upon which we stood, we entered upon the hard smooth plain, we had just been surveying with so much doubt and interest, composed of bluish clay, iucrusted, in wavy lines, with a white saline substance, the first representing the body of the water, and the last the crests and froth of the mimic waves and surge. Beyond this we crossed what appeared to hav been the beds of several small lakes, the wa ters of which haveevaporated, thickly incrus ted with salt, and separated from each othe bs small mould-shaped elevations, of a white sandy, or ashy earth, so imponderous that it has been driven by the action of the winds into these heaps, which are constantly chang ing their positions and their shapes. Our mules waded through these ashy undulations sometimes sinking to their knees, at others to their bodies, creating a dust that rose above and hung ovel us like a dense fog.
From this point, on our right and left, dia gonally in our front, at an apparent distance of thirty or forty miles, high isolated mountains rise abruptly from the surface of the plain. Those from our left were as white as the snowlike face of the desert, and may be of the same composition, but I am inclined to the belief that they are composed of white clay, or clay with sand intermingled.
The mirage a beautilul phenomenon I have frequently mentioned as exhibiting itself upon our journey, here displayed its wonderful illusions in a perfection and with a magnifi cence surpassing any presentation of the kind I had previously seen.
I observed that where these appearance were presented in their most varied forms, and with the most vivid distinctness, the surface of the plain was broken, either by chasms hollowed out from the action of the winds, or by undulations formed of the drifting sands. About eleven o'clock we struck a white plain, uniformly level, and utterly destitute of vegetation or any sign that shrub or plant had ever existed above its snow-like surface. Pausing a few moments to rest our mules and moisten our mouths and throats from the scan supply of beverage in our powder keg, we entered upon this appalling field of sullen and hoary desolation. It was a scene so entirely new to us, so frightfully forbidding and unearthly in its aspects, that all of us, I believe, though impressed with its sublimity, felt a slight shudder of apprehension. Our mules seemed to svmpathize with us in the pervad ing sentiment, and moved for ward with relucance, several of them stubbornly setting thei faces for a countermarch.
For fifteen miles the surface of this plain is so compact, that the feet of our animals, as we harried them along over it, left but little if any compression for the guidance o he future traveller. It is covered with a hard crust of saline and alkaline substances
combined, from one-fourth to one-half of an inch in thickness, beneath which is a stra um of damp whitish sand and clay interminled. Small fragments of white shelly rock, of an inch and a half in thickness, which ap pear as if they once composed a crust, but ad been broken by the action of the atmos phere or the pressure of water rising from be neath, are strewed over the entire plain and mbedded in the salt and sand
As we proceeded, the plain gradually became softer, and our mules sometimes sunk to their knees in the stiff composition of salt sand and clay. The travelling at length be came so difficult and fattguing to our animal came so dificult and fatiguing to our animals mong the number), and we consequently slackened our hitherto brisk pace into a walk. About two o'clock A. M., we discovered hrough the smoky vapor the dim nutlines of h mountains in front of us, at the foot of hich was to terminate our day's march, if e were so fortunate as to reach it. But till we were a long and weary distance from it, and from the "grass and water" which we expected there to find. A cloud rose from the south soon afterwards, accompanied hy everal distant peals of thunder a furious wind, ushing across the plain and flling the whole atmosphere around us with the fine particles of salt, and drifting it in heaps like the newy fallen show. Our eyes become nearly binded and our throats choked with the saline matter, and the very air we breathed tasted of salt
The Indian Archipelago.---Coal, TIn and utta Percha.
The tin mines in the Archipelago are of the kind called washings, and Mr Logan the Edior of the Journal of the Indian Archipelago, peaks of no less than 60 mines, producing 3000 tons of fine grain tin yearly. The tin fields to which they belong stretch over a vast district of the peninsula, extending from the seventh degree of north to the third degree of south latitude. The mines are wrought principally by Chinese colonists, whoare report ed to toanage them with considerable skill, producing metal of a finer quality than that of Europe
The annual product of British tin is about 5000 tons-the annual product of all Europe eside is only about 230 tons,-a great difference indeed. Great Britain is the tin sheet hop of the world and she is therefore throwing out her grappling irons for tin in India and the above news shows that she is not unsucessful.
The Island of Borneo has lately been taken possession of by them under Mr. Brooke. This sland is a splendid empire, full of all vegetable wealth, apparently, from rice and spices down to gulta percha, and a mineral treasu$y$, from gold and diamonds up to iron and coal. Great fields of bituminous coal have ecently been discovered. In Borneo coal has been traced along one river for 20 miles into the interior. It is of an excellent quality, well adapted for steam navigation-a particular point in wise British policy.
Gutta percha is now become a great article of export from the Archipelago. During the first 6 months of last year, no less than 27,000 ons was exported to England. In coliecting his gum the tree which yields it, is destroyed and yet the produce of one huge tree only yitlds a product valued at a dollar and a half. The tree exists in abundance over an area of 500 thousand square miles. There need thereore be little apprehension of its speedy des ruction, and by the time this takes place ome other substitute may be discovered,nature's laboratory has had but a limited ex ploration.

## Use of Tobacco.

Prout, in bis Treatise on Disease, say There is an article much used in various ways though not as an aliment, the deliterious effects of which on the assimilating organs require to be briefly noticed : namely, tobacco Although confessedly one of the most viru lent poisons in nature, yet such is the fascina ting intinence of this noxious weed, that man kind resort to it in every mode that can be devised to insureits stupifying and pernicious agency. Tobacco disorders the assimilating functions in general, but particularly, as I be-
eve, the assimilation of the saccharine prin ciple. I have never, indeed been able to trac the development of oxalic acid to the use of tobacco, but that some analagous and equally poisonous principle (probably of an acid na ture) is generated in certain individualsby it abuse, is evident from their cachetic look and from the darkish and often greenish yel low tint of the blood. The severe and dyspeptic symptoms sometimes producel by invet rate snuff-takers are well known; and I hay more than once seen such cases terminate fa tally with malignant diseases of the stomach and liver. Great smokers, also, especially those who employ short pipes and segars are said to be liable to cancerous affections of the lips. But it happens with tobacco as with deliterious articles of diet, the strong and healthy suffer comparatively litlle, while th weak predisposed to diseases, fall victims to it poisonous operations. Surely, it the dictates of reason were allowed to prevail an article so injurious to the health and so offers.ive in all its forms and mode of employment would speedily be banished from common use."

## The Axe and the Saw.

Early one spring morning, when the sun had scarcely melted the hoar frost from the brown face of the winkled earth, an old ax happened to fall in with a saw. There was a'cutting air' abroad, that threatened th ewly shaven chin with chaps!
'Ah! my old blade!' said the Axe, 'how goes it with you? I came purposely to se how you do'
'I really feel much ubliged to you,' said the Saw, 'but am sorry to say that my teeth ar very bad. My master has sent for the doc tor, who, 'twist you and me and the post, is no better than ' an old file '" I was in the workshop last night, where,-
'Where, no duubt, you - saw a great deal acetiously interrupted the Axe.
Tne Saw showed his teeth in a sort of grin etwixt melancholy atd mirth, and resumed-
'Why' I may say so with some truth; and consider it no more than a duty. I owe Mr Carpenter, to do as much as I can, in spite of ray teeth for he is liberal,-in point of board

And, do you never srow rusty? asked the
Axe
Not with over work,' replied the Saw and, indeed, I have always found that constant empluyment best preserves our polish, which, after all, is only artificial.

You are quite a philosopher.'
'Not exactly so ; for I sometimes do grow xceedingly hot, and lose my temper.'
'And what says ynur master ?
'Why he generdly desists awhile and I soon row cool ardin, and then I cut away like zor through a piece of mottled soap!
'You are a happy fellow,' said the Axe
'How diffirently am I siluated! My mas er is a chopping boy, with a thick block which is tantamount to saying he is a fat fool He is very sharp with me sometimes; and when he fiuds I am inclined to be blunt, he grinds me most cruelly.'
'Alas!'cried the Saw ; 'it's the way of the world, my friend; for i have invariably remarked, that the rich always griad the poo or the sake of the 'chips.
'Bravo!' exclaimed the Axe
'You see l've not lived in tha world al this time without getting a notch or two, said the Saw.
'Nor I either,' replied the Axe; although in obtaining the said notches, I have not on ly lost my courage but a portion of my me tal, too!'
'Well, I never saw !'exclaimed my friend 'how you talk! I am sure your teeth do not give you any trouble, at ans rate.
'I ax your pardon, old boy,' remonstrated the Axe; 'for, although I do not complain o my teethexactly, my chops give me a pretty considerable deal of trouble, I can tell you.
The Saw grinned approval of the Axe'swit
'Peace!' exclaimed the Axe. 'Here comes Mr. Carpenter ; su'dun't show your teeth til you can bite,' 1 believe that is the maxim of a relation of yours?
'Not a relation,' said the other:though they are the words of a roise old saw.'

Clarified honey applied on a linen rag i said to cure the pain of a burn as if by magic.

Velocity of Light.
Light travels with the amazing velocity of 192,000 miles in a second of time. It may be interesting to know how philosophers have been able to determine, with such certainty that light really travels with this amazing ve locity; for the fact is known as certainly as any phenomenon in nature. The method adopted was the following:-The eclipses of the satellites or moons of the planet Jupiter had been carefully observed for some time and a rule was obtaned, which foretold the instants, in all future time, when the satellites would glide into the shadow of the planet, and disappear, or again to emerge into view Now it was found that these appearances took place sixteen minutes and a half sooner when Jupiter was near the earth, or on the same side of the sun with the earth, than when it was on the otherside; that is to say, more dis tant from the earth by one diameter of the earth's orbit, or path in the heavens which it takes in revolving round the sun, and at all intermediate stations, the difference diminish. ed foom the sixteen minutes and a half, in exact proportion to the less distance from the earth. This proves, then, that light takes sixteen minutes and a half to travel across the earth's orbit, and eight minutes and a quarter or half that distance, or to come to us from the sun. This being its amazing velocity, it may, for all useful purposes on the earth, be regarded as passing between bodies instantaeously; and it is $f$ or this reason that we perceive the flash from a gun at a distance, for a preceptible time, betore we hear the report, and why we may count several seconds be ween the appearance of a flash of lightning, and hearing the thunder which follows.

## Bean Soup.

Put two quarts of dried white beans into soak the night before you make the soup, which should be put on as early in the day as possible. Take five pounds of the lean of resh beef-the coarse pieces will do. Cut hem up, and put them into your soup pot with bones belonging to them, (which should be broken to pieces,) and a pound of bacon cut very small. If you have the remains of a piece of beef that has been reasted the day before, and so much underdone that the juices remain in it, you may put into the pot, andits ones along with it. Season the meat with pepper and salt, and pour on it six quarts of water. As soon as it boils, take off the scum, and put in the beans, having first drained them and a head of celery, cut small, or a tablespoonful of pounded celery seed. Boil it slowy till the meatis done to shreds, and the beans all dissolved. Then strain it through a sieve into the tureen, and put into it stall squares of toasted bread, with the crust cut off. Some prefer it with the beans boiled soft but not quite dissolved. In this case, do not strain it but take out the meat and bones with a fork.

## Fabie.

The sword of the warrior was taken down to brighten; it had not been long out of use. The rust was soon rubbed off, but there were pots that.would not go, they were of blood, was on the table near the secretary. The pen took advantage of the first breath of air to o move a little further off.
' Thou art right,' said the sword, ' I am a bad neighbor.
I fear thee not," said the pen, ' I am more powerful than thou art ; but I love not thy ociety.
'I exterminate,' said the sword.
'And I perpetuate,' answered the pen, 'where were thy victories if I recorded them not ?Even where thou thyself shalt be one dayin oblivion.

After all that has been said against the moustache we would not condemn a man as a confirmed villian because he wears a long black or red whisk between his nose and nouth. Ic's a sorry sight, we know, but we would rather pity the wearer or give him a passing kick, than go so far as to advise a refusal to him of a trifling loan to buy a glass of beer. They are very useful to sop up gra-
