

Our Prize Essay.

SCIENTIFIC AMERICAN OFFICE, April 14, 1849.

EDMUND MAHER, Esq.

Dear Sir .- The Committee to whom the Essays on the Patent Laws, for which we offered one hundred dollars as a prize, were submitted, have this day decided in favor of No. 9, as the meritorious applicant, which upon referring to our index we find placed op posite your name.

Enclosed we send you a check for one hundred dollars, which please acknowledge by return of mail.

Respectfully your obd't. serv'ts.,

MUNN & Co.

MESSRS.EMUNN & Co.

Gentlemen .- I have received yours of the 14th inst. with its enclosure, informing me that the prize of \$100, offered by your firm for the best Essay on the Patent Laws, has been awarded to me by the Committee of Ex-

Gratified at this marked evidence of approval of my views and suggestions on the subject, from such a distinguished source. I shall at some future period, after the publication of my Essay, follow them up with additional suggestions [of alterations in the minor details of the existing Patent Laws, through the columns of your widely circulated and useful paper.

Very respectfully, yours, &c.

EDMUND MAHER. April 17th, 1849.

It will be observed from the above letters that the hundred dollar prize has been awarded to Edmund Maher, Esq. of Washington,

We have received 19 Essays from different parts of the country, many of which are exceedingly well written, but none of which the Committee considered so practical and so tending to advance the interest of the poor Inventor as the one selected.

We shall print several thousand extra co pies of each of those numbers of the Scientific American, in which the Essay will appear and those of our readers who desire to be supplied with extra copies for distribution among their friends can be furnished at the low price of \$2,75 per hundred. It is our design to furnish every paper published in the United States with copies of the Scientific American containing the Essay, and we hope those who feel an interest for the inventor and desire to enhance the progression of the Arts and Sciences and thereby promote the interests of all, will find space in their several papers to publish it. The series will commence with our next number.

E. G. Allen's and J. P. Woodbury's Pla. ning Machines.

We have received communications from each of the above gentlemen respecting their Planing Machines. From their tone it is evident to us that there is a personal feeling between them, which has led us to decide against publishing anything more about the matter, (in a controversial manner,) or publishing any communication on the subject. We have no doubt but what both inventions are good, but it is not in our power to judge of the merits of either at present, as the features of distinction between them are unknown to us .-We are willing to publish an engraving and description of both inventions and this is all. It is the only honest way to decide the matter, the only way whereby the public will now be satisfied,-the only way they can judge of the matter. Our columns are not open for personal controversies, as they are of no benefit to the public and certainly of far less benefit to the parties concerned. Discussions on scientific questions-if brief and in good spirit and language, are acceptable, not otherwise. See Mr. Woodberry's advertisement on another page.

Silk.

"The quantity of Silk used in England alone amounts each year to more than four millions of pounds in weight-for the production of which myriads upon myraids of insects are required. Fourteen thousand millions of animated creatures annually live and die to supply this corner of the world with an article of luxury. If astonishment be excited at this fact, let us extend our view to China and survey the dense population of that widely spread who subscribed himselfagent. The plaintiffs region, whose inhabitants from the Emperor say, that the factories being conducted by an on his throne to the peasant in his lonely hut, agent, who did not disclose his principal, and are indebted for their clothing to the labors the proceeds having been conveyed, as they of the Silk Worm. It is truly remarked by Scott's excellent paper, that imagination fatigued with the flight, is lost and bewildered in contemplating the countless numbers which. alleged, furnished the means. every successive year spin their slender threads for the service of man."

It is perhaps as astonishing to reflect that the manufacture of silk in this country has as yet obtained no particular importance, when compared with Cotton and Woolen fabrics -The value of silk imported from Europe and Asia exceeds \$20,000,000 annually, and no buildings for the manufactory of percussion is as well adapted to the production of the raw material as that of any other. The only trouble heretofore has been in producing a color equal to the Italian Silk. We are pleased to observe from some samples recently shown us, that these objections are fast being overcome, and we sincerely hope that our enterprising manufacturers will turn their attention more particularly to this important depend wholly upon foreign countries for supplies which annually drain so large an amount of money from us. We believe that American broadcloths are equal in point of color and finish to French. We speak more particularly of the finer qualities, such as we have examined from the manufactories of the Slater Mills cation between the northeastern portion of at Webster, the Northampton Mills, and some other Eastern mills, which it is not necessary to mention. We introduce this subject merely to show the importance of larger exeriment in branches; which claim tively little attention The manufacture of manently advance the interests of both places. silk is very much neglected, in proportion to its immense demands. In some portions of the Western country, this business is gradually increasing; not however in proportion to the advance of cotton, woolen, &c. wbich is spreading rapidily throughout the South and West-a cheering evidence of the enterprise and resources of this rapidly growing country. We have called attention to this subject before, and will frequently do so again, as we consider ourselves to be preachers to the people on the texts of improvements in Science, Art and Manufactures.

Patent Cases.

On Monday the 16th inst. before Judge Nelsou, in the U.S. Circuit Court in this city, a verdict of 6 cents was given for infringement machineshops, engineers, colleges, academof a patent, Alfred J. Serrill against George ies and steamboats we have ever seen offered Crawford. The patent is for making carpenter's mouldings. This sustained the patent.

Another case of some interest decided on the same day, was that of Charles Goodwin and others against George Waring for alleged infringement of patent for design of stove or- Published by Munn & Co. Scientific Amerinaments. For defence it was contended that can, 128 Fulton-st. Single copies complete, the patent was invalid, having been granted \$3; Map Form mounted, \$3,50. for fourteen years, whereas a patent for designs cannot be granted for more than seven Tribune of Saturday, April 14th. The charts years. The Court sustained the position and a nonsuit was entered.

Here was a mistake committed by the Patent Office, but the parties themselves are to blame and more so the counsel who would come into Court with such a document. Thare should be some reform in the law to allow other counsel than attorneys to practice in drill into our noddle with the soft side of the the U. S. Circuic Court, at least in Patent ca-

Another Case.

On the 11th inst. in Philadelphia, before

plaintiff alleges that in 1845 and '48, lampblack was burned in a confined room, according to Mint's method, at a factory near Bush Hill, and at another in Callowhill street, near Fairmount ; that those factories turn out from twenty to sixty barrels of lampblack a week; and that the lampblack thus turned out went to the establishment of Charles Lennig. The factories were not conducted in Mr. Lennig's name, but in that of a person alllege, to Mr. Lennig's store, that the presumption was that the latter was the principal, he being a man of substance, and, it is

The Plaintiffs suffered a nonsuit.

Percussion Cap Manufactory, Frankford Philadelphia County.

The Frankford Herald says " a purchase is about to be made by the General Government of land in the vicinity of the Frankford Arsenal, for the purpose ot erecting suitable one presumes to doubt the fact that our climate caps. An appropriation was made at the last session of Congress, for the purchase of the land and erection of the buildings and our State Legislature have just passed an act consenting to the purchase. This purchase, we understand embraces the "Ashmead Place," adjoining the Frankford Arsenal, on the River road, about a mile from Frankford, and buildings are expected to be put up during the present season. We learn that percussion business. There is no reason why we should caps for the United States service will be manufactured at this place, and that it will bring into our vicinity about two hundred workmen. If this information be correct, the demand for dwelling houses in White Hall will be greatly increased and improvements accelerated. A more direct communithis borough and White Hall in that event will be required. Meadow, Foulkred and Harrison streets, will have to be extended to meet the streets of White Hall, and this will have a direct tendency to build up and per-

Cook's American Condensing Steam En-

This is the title of a very handsome Chart of Explanatory Drawings of the Steam Engine, such as are used on the Hudson River and Sound Boats, representing the machine with all its internal parts laid open to the eye, each part colored to represent the metal of which it is made. / References are on the Chart to a neat book of notes explaining its various pieces: the explanations are so plain that any one, although entirely ignorant of its structure beforehand, can become perfectly acquainted with the machine in half an hour. The plate isvery large, being 28 by 38 inches in size, and the best adapted for to the public. Having received the approbation and praise of our first engineers and scientific professors, and being the production of a well-known draftsman of our City, it will, without doubt, become a standard work .-

The above we copy from the New York above alluded to we have constantly on hand and can furnish at the price therein named.

Errata.

Our readers will be pleased to overlook the phonography of a letter on the second page of our last number. In future we will try and not forget what old Dominie Brown used to ten per cent. of the capital will easily pay ruler, " positive good, comparative better you rascal."

New Species of Squirrels.

A correspondent of the Southern Planter Judges Grierand Kane the oldcase of Richard says that on the Cold Mountain in Virginia, S. Childs vs. Charles Lennig was brought up. he has seen two species of squirrels not known This is an action for the alleged violation of in Eastern Virginia, nor perhaps any where a patent to J. G. Mint, for a method of burn- further South. One is about the size of a ing lampblack in a confined room, without large grey rat, of a dirty red color, and the stop bleeding at the nose. He explains the the necessity of a draft or chimney. The let- other about two thirds the size of the grey fact physiologically, and declares it a positers patent were assigned to plaintiff. The squirrel, and of a scarlet red color all over.

A Phenomena in a Hurricane.

There is a curiosity in the possession of Dr. Beck, Professer of Chemistry in Rutger's College, New Brunswick, consisting of a pane of glass with a hole in the centre, making a circle as perfect as if drawn on mathematical principles. It was, perforated by the extraordinary hurricane which passed over New Brunswick about 16 years ago, levelling in its path a streak of houses the whole length of the town. In one of the windows this pane was discovered with a hole in it, and what is remarkable about it, is, that the perimiter of the whole is as smooth as a polished gem, sothat the finger may be rubbed around it with. impunity. It has the appearance of being forced out while the glass was in fusion, hence the theory to explain it, namely, that the current of air had a spiral motion in the centre of the column, the astonishing velocity of which had collected a nucleus of electricity equivalent to a voltaic pile of gigantic construction, this heat being opposed by the glass sufficiently absorbed it to prevent the communication of fire to other elements in its path, while the suddenness of contact with this amazing heat caused the perforation of a cavity so perfectly circular, and smooth. The pane was taken from the window, and now occupies a place in the Doctor's cabinet.

Scientific Discoveries.

Mr. E. Merriam, of N. Y. claims to have arrived at the following conclusions, which may be regarded as new in the catalogue of scientific of the present age, to wit: The connection of earthquakes with the aurora; the collapsing of steam boilers by the peculiar state of the atmosphere surrounding them; the absorption of electricity by hot iron; the regular movement of the cold in cycles; and the accumulation of saline deposits in the interior of continents where three rivers run form one centre, east, north and south to the ocean.

Wonderful if true, but as they are not fully established, we will await with calmness the climax of the discovery.

The Mulish Balloon.

The Flying Machine refused to fly in Boston. What a stubborn animal. We are afraid that it has got a touch of the mule in it, and peradventure the unfortunate wights that mount her to go to California, may find that she is neither to be coaxed nor drove. It was positively asserted in hand bills that it was to depart for San Francisco on the 15th inst.

"But that day has come and gone,

Not so Porter and Robjohn."

Disastrous Conflagration.

News from Toronto states, that city has been visited by a terrible fire which has destroyed a large part of the town. The loss is estimated by some as high as six hundred thousand dollars!

The magnificent Cathedral of St. James, erected a few years since on the same spot where stood the former Cathedral, which was destroyed by fire ten years ago, is included in the conflagration

Death of Captain Pennoyer.

The Charleston Courier announces the death of Captain James Pennoyer, at New Orleans of cholera. It will be recollected that Capt. Pennoyer was the pioneer in the enterprize of establishing steam communication between New York and Charleston. The first through trip ever made by steam between the two cities, and in fact the first steam service accomplished, was performed in the little steamer David Brown, commanded by Capt Pennoyer.

The Debt of England.

The National Debt of England, says Mr. Rigely Watson, in his revised arithmetic, is £772,000,000, and the aggregate capital of England and Irelaud £7,750,000,000; so that off the debt. It is as if a man with a capital of £7,750 was indebted only to the amount of £772. Mr. W. would propose ten years as the time for paying the debt, and thinks it would be very easy for the owners of realized property to do it.

To Stop the Bieeding at the Nose.

Dr. Negrier, a French surgeon, says that the simple elevation of a person's arm will always tive remedy. It is certainly easy of trial.
