fields of operation. The opportunities offered at home are heating the bulb until it acquires a constant temperature, large enough to satisfy his ambition; and he does not know which is indicated by the non-appearance of air bubbles at what he could do with foreigu patents it he had them. The the orifice of the side tube which is plunged under water; more enlightened of our inventors, however, are finding out the stopper is then removed, the weighed quantity of subthe impolicy of such indifference to European markets; and stance introduced and allowed to fall into the bulb, the stopbefore many years the neglect to take possession of them | per quickly reinserted, and the end of the side tube then tion was sent out by Dr. Dickson-namely, a practical will form the exception and not the rule.

Our national redress, therefore, against the lawful appropriation of unpatented American inventions abroad, and the moved, and the air thus collected is afterward measured in crossed to Port Clarence, Alaska. Thence we crossed to consequent loss to our national income, is rather through the the usual manner. In the case of substances which undergo enlightenment of our inventors by means of information oxidation when heated in air, the air is first displaced from such as the Leipsic consul sends, than through any attempt the apparatus by a current of pure nitrogen. In this manat retaliation by the exclusion of foreign inventors, as Com- | ner the volume of vapor, measured at the atmospheric tem missioner Paine is reported as favoring. The Post writer says:

"The only practical measure of redress open to our government would be to adopt a scale of fees for foreigners to correspond with those charged to American inventors. This course, the commissioner thinks, would speadily bring assumption that the chlorine molecule has the formula Cl₂, about a desired change, as foreign inventors regard the American market as an exceptionally good one for mechanical devices, and are always anxious to take out American patents '

the attempt. The expressed object of the American patent from the condition of ozone to its ordinary condition. Two system is the advancement of the useful arts-the multiplication and perfection of American industries. To accom atom of chlorine is (like ozone) a compound of three subplish this end, inventions are encouraged by offering the atoms, with the formula Cl₂ (instead of Cl₂ as commonly inventor, for a term of years, the exclusive right to use, make, and sell his invention and its products. The nationality of the inventor has nothing to do with the matter. If In confirmation of the correctness of the latter supposihis invention is new and useful we want the benefit of it; tion, there comes the report from Zurich, printed in the and we are more likely to reap that benefit by treating him | Chemical News, that Professor Meyer, in conjunction with fairly than by trying to exclude him or rob him. The cir Herr C. Meyer, has determined that in all probability oxygen cumstance that certain foreign governments do not show a is one of the components of chlorine. Still further, an uncorresponding willingness to accept the benefits offered confirmed report has reached Nature to the effect that the them by American inventors is no excuse or reason for our Messrs. Meyer have actually separated oxygen from chloimitating their unwisdom. The moment we look upon in-|rine. Should these reports be confirmed, the chemistry of ventions in their proper light, as the bases of new industries the non-metals will enter at once upon a new era. In the and the improvement of old ones, all talk of retaliating communication to the Berlin Chemical Society, describing against foreign shortsightedness in the matter of patent the experiments noted, the Messrs. Meyer state that bromine rights, by handicapping foreign inventors, is sheer nonsense. The best way to induce foreign governments to treat American inventors more liberally is to prove to them by our industrial progress the vital advantage of treating liberally all inventors, their own as well as ours.

are accustomed to here, and every year those privileges in-, the long Arctic winter. crease, and rapidly increase in money value.

-----GELATINE NEGATIVES.

Much success has of late attended the production of photoas the vehicle to carry the sensitive silver instead of collodion. It was claimed, among other advantages, that the gelatine was cheaper than the collodion. It seems now to of that country, at least, the gelatine negatives are unstable.

The film expands and contracts, under the varying degrees of atmospheric moisture, to such an extent that the usual varnish soon cracks and the surface is covered with a fine powder, while the surface of the gelatine retains the markings of the cracks, and the negative is spoiled. To prevent Dickson, near the mouth of the Yenisei, on August 6. this loss of negatives, it is recommended that gelatine negatives be covered with a film of collodion and then varnished. The collodion has a greater expansive quality than the varnish, and does not crack. It perfectly preserves the gelatine negative. But inasmuch as collodion makes first-rate negatives, would it not be better to omit the gelatine altogether?

In the meantime we will suggest that the latest improvement in the production of gelatine plates-formulæ for which we have heretofore published-consists in adding a quarter of a grain of gelatine to the solution of bromide employed in precipitating the silver. This simple little change gives ease and certainty to the production of dry gelatine plates of the highest sensitiveness. This improvement confirms the suggestion of M. De Pitteurs, that the remarkable sensitiveness of gelatine plates is due to a chemical combination between the gelatine and silver which favors the action of light on the bromide of silver.

ventor utterly fails to appreciate the real value of foreign bath or in a bath of molten lead. The operation consists in brought under the measuring vessel; directly air ceases to issue from the extremity of the tube, the stopper is reperature and pressure, generated by a known weight of substance, is ascertained, and the density deduced from these data by a simple calculation.

Experimenting with chlorine the numbers obtained at a temperature about 620° C. agreed with those required on the which is that generally accepted. At higher temperatures, however, a diminishing density was determined, until at about 1,200° and above, the density was two thirds that obtained at 600°. In this respect the action of chlorine, Possibly it might, but we should be the heaviest losers by when heated, is precisely like that of oxygen when passing explanations are possible. Either what is regarded as the held), or chlorine is not an element, but a compound of at least two elements which are dissociated by heat.

behaves like chlorine; and if chlorine has been dissociated, the rest of the group are likely soon to follow.

THE NORTHWEST PASSAGE SUCCESSFULLY MADE.

The following report of the entire voyage, as told by Pro-Herald. The Professor says:

"We sailed from Gothenburg on July 4, 1878, and a graphic negatives in which a substratum of gelatine is used four days' sail brought us to Tromsëe (a Norwegian port on an island of the same name), where our outfit of furs and Yugor Strait (south of Nova Zembla) on August 5. There shipmasters to go that way. was not a particle of ice to be seen between the Waigatsch (Vaigatza, a Russian island) and the continent. The Kara Sea, hitherto dreaded by all sailors in the Arctic regions. was equally free from ice, and anchor was cast at Port

STEERING NORTHEAST.

"After a three days' delay there the two steamers of our expedition steered northeast toward the dreaded Taimur land and the North Cape. The ice arrested our passage and we were compelled to remain at Tajoyr (Cape Taimur?) four days. On August 19, Tsejdekin, the extreme northern point of Asia, was reached, where a short rest was taken. The Vega coasted the peninsula, very little ice being encountered, and anchored at the mouth of the Lena River on August 26. To the northeastward were the islands of New Siberia, which we soon sighted, but were anable to explore

detained in the ice at this point 264 days, but were released on July 18, and passed East Cape into Behring Straits on the 20th. Such is the story of our voyage.

COMPLETE SUCCESS.

"I fully accomplished the object for which the expediproof of the existence of a Northeast passage. Then the Asiatic coast was followed and St. Lawrence Bay was Koniyan, dredging carefully in order to determine the formation of the bottom of the sea, many specimens of the fauna and flora being obtained. The location, breadth, velocity, and approximate volume of the currents of the Arctic and Pacific Polar currents were charted and calculated. Having touched at St. Lawrence Island we next proceeded to Behring Island, where we received the first news from Europe through the resident agent of the Alaska Trading Company. The fossil remains on Behring Island are of immense variety. A new marine animal was here discovered, which we named Rhyting stellari. The Vega left the island on August 19, and had a pleasant voyage until August 31. when a severe gale was encountered, accompanied with lightning. During the storm the lightning struck and shivered the maintopmast, slightly injuring several men. We arrived off Yokohama at half past eight on the evening of September 2. All are well, and no deaths have occurred

PROSPECT.

"The Vega is the first vessel to make the passage, and I think the voyage from Europe to Asia by Behring Strait is certain and safe, with very little more experience of navigation in the Northern seas. From Japan to the mouth of the Lena River there are no difficulties in the proper season for experienced sailors. The Lena River taps Central Siberia, and a large prospective trade can readily be developed."

Apart from the obvious commercial advantages to result from the outlet to Siberian trade, opened up by this plucky and successful voyage of the Vega, and the contribution to science made thereby, it is impossible as yet to estimate the probable good results of the expedition. If, as Professor Nordenskjöld believes, a safe and easy Northeast passage is demonstrated, its availability must be confined to two or three summer months at best-too brief a period for an established commercial route; and vessels which take the i southern routes during ten months of the year, are not likely The Swedish exploring steamer, Vega, of the Norden- to venture into icy waters for a single trip, however much it Be that as it may, the fact remains that most European skjöld expedition, arrived at Yokohama, Japan, Sept 2. The may promise to save in distance. With good luck the northgovernments do now offer our inventors privileges that are Vega was in excellent condition; all on board were well, ern voyage, say from England to Japan, might possibly be worth securing, though at a somewhat higher cost than we and there had been no sickness or scurvy on board during made in half the time now required, but instead of having open sea room for the most part, the trip would be mainly along a dangerous and inhospitable coast in a narrow chanfessor Nordenskjöld, was telegraphed to the New York nel between ice fields and foggy shores, with the ever imminent risk that northerly winds might at any time bar the passage with Arctic ice floes, and imprison the ship for an Arctic winter.

Under improbably favorable conditions the Northeast necessaries for the high latitudes was completed. Here we passage may prove a useful route between Western Europe were joined by the companion steamer, the Lena. On July and our Pacific coast; but it will require more than one suchave been ascertained in England that for the damp climate 25 both vessels sailed from Tromsee, passed through the cessful passage-a two seasons' trip at that-to induce many

PLATINUM IN THE UNITED STATES.

Notice was taken some time since of Mr. Edison's circular letter of inquiry with regard to the possible occurrence of platinum in various parts of the country. Mr. Edison informs us that, so far, he has received some three thousand replies. Instead of being an extremely rare metal, as hitherto supposed, platinum proves to be widely distributed, and to occur in considerable abundance.

Before Mr. Edison took the matter in hand platinum had been found in the United States in but two or three placesin California and in North Carolina-and in these places it occurred but sparingly. It is now found in Idaho, Dakota. Washington Territory, Oregon, California, Colorado, Arizona, New Mexico, and also in British Columbia.

It is found where gold occurs, and is a frequent residual because of the great field of ice that girt their shores. The of gold mining, especially placer mining. Mr. Edison mouth of the Kolwya River (latitude 69 deg. 30 min., thinks he can get 3,000 lb. a year from Chinese miners in longitude 161 deg. 30 min.), a broad estuary, was found one locality. One gravel heap is mentioned from which a open, and we hastened to make all possible progress east- million ounces of platinum are expected. Hitherto the proward. Our difficulties soon began, however, and increased duct of the entire world would not suffice to supply electric daily. We were delayed much with the ice between Cape lamps for New York city. Now Mr. Edison believes that

Employing the improved method of determining vapor on the 28th near a Tchuktchi settlement (latitude 67 deg. 7 densities, which he introduced last year, Professor V. Meyer, min. north, longitude 177 deg. 24 min. west). of Zurich, has lately subjected chlorine to a series of tests THE WINTER IN THE ICE. which strongly indicate a compound character for that hitherto supposed element. As described in Nature, the apparatus employed is also extremely simple, and consists land. The entire ship's company maintained the best of of a cylindrical bulb of about 100 c.c. capacity, sealed to health and spirits. Not a single case of scurvy occurred on which is a glass tube about 6 mm. in diameter, and 600 mm. board. During the shortest day the sun was above the hor- | metals. long; this tube is widened out at the open end, so as to admit izon less than three hours, and then only the upper limb

Cook and Van Karema. We crossed Kolintsehm Bay on our gold mines will supply more than will be required. The September 27 with comparative ease, but were imprisoned possible uses of this metal in the arts, however, are so numerous that there is no danger of an oversupply.

In addition to platinum Mr. Edison finds, among the large number of samples received daily, many other valuable "We wintered in the pack ice at this point, one mile from metals and minerals, so that his researches in this direction are likely to result in increasing greatly the resources of our country in respect to the rarer and more costly minerals and

THE Insurance World thinks our present complicated sysof the introduction of a caoutchouc stopper, and has a side was visible. At this point much time was devoted to intertube, 1 mm. in diameter and 140 mm. long, sealed on to it esting scientific and ethnographic studies. There were 4,000 tem of fire alarm telegraph should be substituted by the much about 100 mm. below the open end. The side tube is once inhabitants in the several villages near by, who subsisted by more desirable system of telephonic communication. The bent nearly at right angles and the end slightly turned up, fishing and sealing. They are called the Tchuktchi, and are advantages, like an axiom, are so self-evident as not to admit so that, when dipped into water, it will deliver gas into a a very agreeable class of people for an exploring party to of any elaborate demonstration.. One of the special features graduated glass vessel inverted over it. For determinations meet. They supplied the expedition with bear and reindeer is that it will enable the person sending in the alarm to affix at high temperatures the bulb is constructed of porcelain meat. The cold was intense, averaging 36 centigrade (32.2 the exact location of the fire, and thus obviate the necessity and is heated in a gas furnace; when operating at lower degrees below Fahrenheit.) The game was abundant in the of the firemen hunting for the exact point in the district temperatures the bulb is heated either by means of a vapor, spring, wild fowl being taken in large numbers. We were, at which their services are needed.
