## Athisellurputy

The Planetary System，as it is now Un－
Sir J．Herschel has lately expressed his opim ion，that it is impossible any longer to attempt the explanations of the movements of all the heavenly bodies by simple gravitation，as un－ derstood in the Newtonian theory－these com－ ets，with their trains perversely turned from the sun，deranging sadly our systematic views． Nor are there（writes Humboldt）any constant relations between the distances of the planets from the central body round which they re－ volve，and their absolute magnitudes，densi－ ties，times of rotation，eccentricities，and in clinations of orbit or axis．We find Mars， though more distant from the sun than eithe the earth or Venus，inferior to them in magni－ tude；Saturn is less than Jupiter，and yet much larger than Uranus．The zone of the telescopic planets，which are so inconsiderable in point of volume，viewed in the series of dis tances commencing from the sun，comes next before Jupiter，the greatest in size of all the planetary bodies．Remarkable as is the smal density of all the colossal planets which are farthest from the sun，yet neither in this res－ pect can we recognize any regular succession Tranus appears to be denser than Saturn and （though the inner group of planets differ but little from each other in this particular）we find both Venus and Mars less dense than th earth，which is situated between them．The time of rotation increases，on the whole，with increasing solar distance，but yet it is greate in Mars than in the earth，and in Saturn than In Jupiter．After other remarks of the sam character，he adds，＂The planetary system，in its relation of absolute magnitude，relative position of the axis，density，time of rotation nd different degrees of eccentricity of the or bits，has，to our apprehension，nothing more of natural necessity than the relative distribu－ tion of land and water on the surface of our globe，the configuration continents，or the ele－ vation of mountain chains．No gamand daw， in these 0 ， regions of space or in the irregularities of th
crust of the earth．
［We have endeavored to find out the place where，and when，Sir John expressed himself， as stated in the above extract，taken from an exchange，but have not been able．It is en tirely opposed to the opinions of other eminent astronomers，and especially to Dr．Nichols， whose lectures in this country，are printed and cheap，and should be read by every person．

## New City of Hadley Falls

In number 8，we gave an account of the great dam at Hadley Falls，and stated that it was taken from the Springfield Republican．－ Since then we have received the Weekly ${ }_{4}$ Times Extra from the New City，which gives us new light on the subject，and we make the follow ing corrections．
The credit of planning the New Dam belongs to John Chase，Esq．，of Cabbotville，with the assistance of Mr．Anderson，who was enginee for both dams．
The Dam is built of solid timbers，twelve inches square，laid crosswise，one above anoth er，with a pitch up stream，and all bolted and pinned together，sunk to the average depth of four feet into the solid rock in the bed of the river，and there firmly secured．The length of the dam between the abutments is 1017 feet its width at the base is 90 feet，and its aver－ age height，28．The slope from the top to the upper edge of the base，is on the angle of $21 \frac{1}{3}$ degrees．The covering is of plank，six inches thick，bolted－down to the timbers．For fifteen feet upwards from the bottom，it is filled with gravel and stone The upper part and ridge are double planked，and the ridge which is pitched down stream，is covered with thick pitched down stream，is covered with thick
boiler plate to protect it from the ice．The amount of timber in the dam is about 4,000 ， 000 feet，and the pressure which the dam is required to sustain when there is but two feet of water on the ridge，is upwards of forty－four $\therefore$ thousand tons．

The abutments and bulkhead，which togeth－ er occupy noout： 200 feet，are constructed of
oolici reasonry．The gateways of the julk－ head，thirteen in number，through which the water is let into the main canal，are eight feet wide by fifteen feet high，with double guard gates，securely put in．A gate－house is to be erected on the bulkhead of sufficientdimensions to cover the gates．

## Extraordina

 The following is an extract from a lette written to his wife by a New Yorker，now working in the mines of California．The let ter bears date，August 26th， 1849There was a gold mine discovered here（what s called Murphy＇s Diggins）one week to－day， it is evidently the work of ancient times－210 eet deep，situated on the snmmit of a very high mountain．－It has made a great excite－ ment here，as it was several days before pre－ parations could be made to ：descend the bot－ tom．There was found in it the bones of a human being，also an altar for worship，and some other evidence of human labor．From present indications it is doubtful whether it will＂pay to be worked，as it is mostly all ock，and will require a great outlay for tools and machinery to work it．
This discovery，if properly pursued by com－ petent observers，may prove of the highest his－ torical importance．It will establish the fact hat the mineral wealth of that region had been known to proceeding generations，and the relics which have survived，may enlighten us as to the nationality of the people who first pierced this mountain two hundred and ten feet，and will doubtless suggest an inquiry in－ to the reason for abandoning the pursuit of gold in a country in whichit seems to abound and where its discoverers had found encour agement to make such extensive excavations in former times．

## Ailigator＇s Nest．

They resemble，says Lyell in his Second Vis it to America，haycocks，about four feet high， and five in diameter at their bases，being con structed with grass and herbage．First they deposit one layer of eggs on a fioor of mortar， and having covered this with a second stratum of mud and herbage，eight inches thick；lay another set of eggs upon that，and so on to the top，there being commonly from one to two hundred eggs in a nest．With their tails they then beat down round the nest the dense grass and reeds five feet high，to prevent the ap－ proach of unseen enemies．The female watch－ es her eggs until they are all hatched by the heat of the sun，and then takes her brood un－ der her care，defending them and providing for their subsistance．Dr．Luzenberger，of New Orleans，told me that he once packed up one of these nests，with the eggs，in a box for the Museum of St．Petersburgh，but was recom－ mended before he closed it to see，that there was no danger of any of the eggs being hatch． d on the voyage．On opening one，a young alligator walked out，and was soon followed by the rest，about a hundred，which he fed in his house，where they went up and down the tairs，whining and barking like young pup ies．They ate voraciously，yet their growth was slow as to confirm him in the opinion，tha individuals which have attained the largest size，are of very great age，though whethe they live for three centuries，as some pretend must be decided by future observation．

## Clairvoyants．

A clairvoyant in Boston and another in Eng－ land，have been paying a visit to Sir John Franklin at the North Pole．
They both prophecy that Sir John will yet come home safe and snug．We have our oubts about this ：we view Sir John＇s case on the darkest side，but it is pitiable to see eople endeavoring，by humbugging，to make gain out of the misfortunes of others．If there any virtue in fiying machines，here would be a case for an elfort．

Steamer Princeton．
This steamer has been demolished at the Charlestown Navy Yard．This is not verycre ditable to her constructors，for she is not as old by five years，as the Great Western．She was built by contract，under the direction of Com．Stockton，and afterwards purchased by Uncle Sam－good natured soul－to feathe somebody＇s nest

Pray or Tlmber．－－Prevenition of Mecay Properly seasoned timber，placed in a dry situation with a free circulation of air round it is very durable，and has been known to last for several hundred years without apparent deteri－ oration．This is not，however，the case when exposed to moisture，which is a
ess prejudicial to its durability
When timber is constantly under water，the action of the water dissolves a portion of its substance，which is made apparent by its be－ coming covered with a coat of slime．If it be exposed to alternations of dryness and mois－ ture，as in the case of piles in tidal waters，the dissolved parts being continually removed by evaporation and the action of the water，new surfaces are exposed，and the wood rapidly de－ cays．
Where timber is exposed to heat and mois ture，the albumen or gelatinous matter in the sapwood speedily putrefies and decomposes， causing what is called rot．The rot in timber is commonly divided into two kinds，the wet and the dry，but the chief difference between them is，that where the timber is exposed to the air，the gaseous products are freely evapor－ ated；whilst，in a confined situation，they combine in a new form，viz．，the dry－rot fun－ gus，which，${ }^{2}$ derrving its nourishment from the decaying timber often grows to a length of many feet，spreading in every direction，and insinuating its delicate
e joints of brick walls
In addition to tho sources of decay above mentioned，timber placed in sea water is very liable to be completely destroyed by the perfor－ ations of the worm，unless protected by cop－ per shea thing．
The best method of protecting wood－work from decay when exposed to the weather is to paint it thoroughly，so as to prevent its being affected by moisture．It is，however，most important not to apply paint to any woodwork which has not been thoroughly seasoned；for in this case the evaporation of the sap being y decays．
Many plans have been proposed for the pre－ ension of the rot．Kyan＇s process consists in impregnating the timber with corrosive sub－ limate，thus converting the albumen into an indecomposable substance．This method，al－ though not always successful，is undoubtedly of great use，particularly where inferior or im－ perfectly seasoned timber has to be used．．It is，however，said to render the wood brittle．
Payne＇s process consists in impregnating the wood with metalic oxides，alkalies，or earths， as may be required，and decomposing them in the wood，forming new and insoluble com compounds．Timber thus prepared will not burn，but only smoulders．
A process invented by a Mr．Bethell，an very good in railway works，is to impregnate the timber with oil of tar ：this appears to be very successful in preventing decay，but the danger of accidents from fire is much in creased．
Strange Mortality in Black River，La．
The Concordia Intelligencer says that many of the planters on Black River have lost the most，while some of them lost all，of their young calves lately．The mortality cannot be accounted for．The animals are smitten as with a plague，and sink beyond all reme dy on the instant．The death of the young alves is not the worst feature of this visitation The mortality is general along both sides of the river，and the people of Black River will have it that this is the sure precursor of an epidemic visitationupon the portion of the hu－ man family dwelling there．We sincerely hope that their fears more than their judge ment have associated such an alarming pros pect with their present comparatively trifing oss．

## Madder．

Some excellent madder has been grown at Flatbush L．I．by a Mr．Gilm，a Dutch gentle－ man．The sample is good and he states that the soil is well calculated for this plant as that of any country in the world，and that the im－ mense importations of this article，within few years may，with ordinary industry，be ren dered useless，by the pr

Sclenee Begetting Sclence．
To the refiectivemindhuman science presents this singular aspect．Whilst the speculativ reason of man continually seeks after unity， strives to see the many in the one－as the Pla－ tonist would express himself－or，as we should rather say，strives to resolve the multiplicity of phenomena into a few ultimate causes，so as to create foritself a whole，some rounded system which the intellectual vision can em－ brace；the discoveries of science，by which it hopes and strives to realize this end，do in fact at every stage，increase the apparent complexi－ ty of the phenomena．The new agencies，or causes，which are brought to light，if they ex－ plain what before was anomalous and obscure become themselves the source of innumerable difficulties and conjectures．＂Each discovery stirs more questions than it sets at rest．Wha on its first introdnction，promised to explain so many things，is found，on further acquain． tance，to have added but one more to the in explicablefacts around us．With each step，also in our inquiry，the physicial agents that are re vealed to us become more subtle，more calculated to excite and eludeour curiosity．Already half our science is occupied with matter that is in visible．From time to time some grand gen－ eralization is proposed－electricity is now the evoked spirit which is to help us through our besetting difficulties－but fast as the theory is formed，some new fact emerges that will not range itself within it；the cautions thinker steps back，and acknowledge that the effort is as yet premature－it always will be prema ture．

## Lectures on California．

The Rev．R．T．Huddart，an eminent divine nd philanthropist，will deliver a lecture on California，at the Tabernacle，on the evening of Dec．4．The object being to raise money or the erection of a church．Mr．H．＇s reputa tion as a lecturer will，we are assured，be a sufficient guaranty that it will be money well expended by those who may wish to attend．－ Tickets 50 cts．－for sale at this office．

## A Striking Thought．

＂The death of an old man＇s wife，＂says La－ martine，＂is like cutting down an ancient oak that has long shaded the family mansion．－ Henceforth the glare of the world，with its cares and vicissitudes，fall upon the old wid－ ower＇s Pcart，and there is nothing to break their force or shield him from the full weight of misfortune．It is as if his right hand was withered－as if one wing of his eagle was bro－ ken，and every movement that he made only brought him to the ground．His eyes are dim and glassy，and when the film of death falls over him，he misses these accustomed tones which might have smoothed his passage to the grave．＇：

Fire and an Afticting Accident
On the morning of Wednesday the 2nd inst． a fire took place in Providence，R．I．，by which the mansion of Mrs．Anna A．Jenkins was burned down，and herself together with her eldest daughter，Miss Sarah Jenkins，perished in the flames．Mrs．Jenkins possessed great wealth and devoted it to the noblest of purpos－ es，good deeds．She was a member of the So－ ciety of Friends，but her charities were con－ fined to no sect．Her daughter was an amia－ ble young lady 22 years of age，and wasen－ gaged to be married to a gentleman in New York．

Smithsonian Institute．
The Agents have engaged the services of professor Guyot，late of Neufchatel，in Switz－ erland，long devoted to the science，and known by his work on Physicial Geography，lately published in this country，to visit the Academ－ es that have been selected throughout the country to register meteorological observations and carry with him the instruments of each－ to direct and aid in putting them up，and also to give all necessary instructions as to to the method of observing and of recording the re－

Brinted directions are preparing at the Smith－ onian Institute，relative！to every matter to be attended to．

A committee has been appointed by the
