Improved Facilities for Cultivating the Domestic Honey Bee.

MESSRS. EDITORS-As a fond reader of your scientific journal, I perceive that you are not only a friend to inventors, but are also desirous of extending to your numerous patrons, through the columns of your paper, a knowlsigned to promote their interest-I therefore have no hesitancy in making a few brief remarks relative to the advancement of a certain kind of enterprize in which I, (and I trust not a few others who peruse the columns of your journal,) am deeply engaged. I allude to the cultivation of the domestic Honey Bee, and them in a recently patented Hive that has come to my notice.

Having for many years entertained a deep interest for the promotion of bee culture, I to time have used not less than a dozen differyear, peculiarly adapted to the prosperity of the bees. Its capacity is conveniently arranall colonies, and encourage and promote their altw of being removed and successively chanthe of the bees. Colonies deficient of honey to removed from the hive, having it to spare. our cities and villages, in 1834 we think. She | from a solution of two parts of sugar and one | ed off, is also offered. The moth miller, whose was a far greater wonder than the present! of water, therefore in a viscous or syrup state, depredations bees have so much cause to dread,

against, and with a little care from the Apiarian, may be effectually excluded from the qualities combined, embrace all of the advanthe several articles which he requires, such as tages requisite for managing bees with ease

> Now, with due respect to the inventor and the anxiety entertained for the advancement of bee culture, I will only add, that the Eclectic Hive meets my highest approval, and I would here cordially invite all scientific Apiarians, or such as are engaged in bee culture, to improve the earliest opportunity to investigate the merits of said hive, and impartially judge and de-

Ellicottville, Jan. 10, 1850.

The New British House of Commons.

The ceiling is divided into 18 compartments by moulded ribs, each space being again subdivided into pannels. Over the Speaker's chair is the reporter's gallery, formed like the other fittings throughout, of oak, and left of its napassed through a second and third filter, but tural color. There is a metal railing above the front of the gallery. The traceried openings seen above the Speaker's chair will be filled in with open metal-work, to screen a gallery to which ladies will be admitted. At the bar end is a much larger gallery for strangers. The floor of the House is of iron, perforated for the purpose of ventilation. The windows will be filled with stained glass; but there are no colored decorations. The length of the chamber is 62 feet, the width 45 feet; nearly onethird less in length, therefore, than the House of Lords, which has the same width and height, and is a double cube. The Commons' lobby, south of the bar, has a similarly formed ceiling, in nine main divisions. The connexion of the House of Parliament with Westminster-hall by means of an enormous archway nearly the whole height of the hall, is formed, although the steps are not yet constructed, and justifies the improved facilities afforded for managing our anticipations of its fine effect. This communicates with St. Stephen's gallery, the stonework of which is being cleaned down. The iron vaulted roof of this gallery is a fine piece of work. The restoration of the Cloisters is being proceeded with; the beauty of the old work there, is marvellous. From 300 to 400 men, in the whole, are at present engaged on the

How to Put Out Fires in the Holds of Ships.

The following letter from the London Times contains information which will be of great interest to captains of vessels and others :-The owners of the Caleb Grimshaw demand a means for extinguishing fire in the hold of a ship. The materials required are nothing more than a cask of common chalk in the bottom of the hold, connected with the deck by a smal 1 pipe, and a two gallon bottle of sulpraric acid which, on the alarm of fire, being poured down the pipe will generate a sufficient quantity of dense smoke (gasin which flamecannot exist) to extinguish any fire however large. I enclose my card, in accordance with your rule, but any chemist knows flame cannot exist in carbonic acid gas, which is generated by the action of the sulphuric acid on the chalk."

The above information bublished more than a year ago in the Scientific American. But the question lies in this, how can the carbonic acid gas get at the fire? The wholeunder hold of the ship might be laid with a strata of it. and holes bored with tubes to communicate with any part of the vessel. There is no other way but this.

Niagara Falls Suspension Bridge Co.

The Hamilton Gazette states that another quarterly dividend of three per cent. per share has been declared for the quarter ending first January last, payable on the first February. The Company appears to be in a most floursh. ing condition, and is one of the most prosperous in the country. The stock is steadily in-Western Ghost. Many people have brought as such it is to be agitated while the gas is is furthermore suitably and properly guarded creasing in value, and is much looked for.
