$\xrightarrow{\sim 1}$ Our weekly List of Patents and Designs con－ tains every new Patent，Re－issue and Design emana
ting from the Department，and is prepared officially exprom the Department，and is prepared officially
expressly for the Scientifc American，and for no oth－ er paper in the city，consequently other journals ar obliged to wiit the issue of the＂Sci．Am．＂in order to profit by the expense to which we are subject，and of course must be one week behind．Those publish－ ers who copy from this department in our columns will，in justice to us，give proper credit for th

LIST OF PATENT CLAIMS issued from the united states patent office，
For the week ending June 11， 1850 To Stephen H．Adams and John A．Wood，of Co hoes，N．Y．，for improvement in Carding and Mixing Wool and Cotson． wool and the cotton separate from wool and the cotton separate from each other，
and the drawing them off together from the se－ cond carding machine，and then mixing their fibres with each other by means of the finish ing or condensing card．
［This is a most puzzling claim，and one that will astonish some of our manufacturers．－Ed．］ To James Barnes，of Franklin，N．Y．，for improves Int in I claim the stops or blocks，E E．cast upon
or otherwise affixed to the box，a，and the or otherwise affixed to the box，$a$ ，and the
stops or blocks， n ，cast upon or affixed to the followers，in such manner that when the two are joined by a central bolt passing through， they will interlock and form a stop coupling， secure from derangement from external causes， the whole constructed substantially in the manner herein described．
To Ransom Cook，of Saratoga Springs，N．Y．，for Blast．

I claim，first，the use and application of boxes，tubs or cavities，attached to wheels， disks or arms by movable joints or journals， in such a manner that they shall enter the wa－ ter with their open sides downwards，and when beneath the same shall empty or discharge the air which has been compressed within them by the water，into a receiver which is separate from such wheels and air boxes；all for the purpose of producing a blast of air to be used in heating，smelting，and other mechanical ope－ rations．
Second，I also claim for this purpose the disk，recess，or concavity of the wheel，so as to allow the receiver to project over the mouths of the air boxes to receive their compressed air． Third，I also claim for the same purpose the cam，the cranks，I，and the cranks attached to the air boxes，together with the piece，on the open side of the boxes，the mouth，for discharg ing their compressed air and the blocks，for throwing forward the cranks．
［See engraving No 24 vol． 5 ，Sei．Am．］
Tof．Durand \＆O．Pecqueur，of Paris，France （Assignors to R．E．Rabeau，of Philadelphia，Pa．， for＇ia
forms．
We claim the combination of the vibrating knife with fluted rollers；constructed and oper－ ting substantially in the manner and for the purpose above fully set forth，one of which rollers being fluted longitudinally and the oth－ er circumferentially，serve firmly to hold the leather in any position
To Duff Green，of Dalton，Ga．，for method of form－ ing embankments，levees，\＆c．
I claim the method herein described，of de－ positing earth to form embankments，levees， etc．，and to fill up low situations，by means of filtering dams，or their equivalents，and a trough or conduit conveying earth and water from a higher level，substantially as herein specified To W．Groat，of Troy，N．Y．，for improvemen djusting packing for oil boxes of axles，\＆c．
I claim the employment of an adjustable
band surrounding the oil packing of railroad car or other journals，so as to admit of adjust－ ment from the outside of the box，in adjusting the packing around the journal，and render the box oil tight，in the manner and for the pur－ pose，substantially the same as herein descri－ bed and represented．

To G．Morgan，Calhoun，of Tenn．，for impro ments in cars for plank roads，wooden rails，\＆c．
I do not claim an endless chain of wheels
working against a stationary rail to support a working against a stationary rail to support a carriage；nor do I claim laying down supports for said wheels，these having before been done； but what I do claim，is the combination of a chain of rollers with broad bearing surfaces running around a stationary rail or track on the carriage with an independant chain，which forms a track for said rollers to travel over
when resting on the ground，and which pass－ when resting on the ground，and which pass
es around outside of said chain of rollers．
I also claim the mode of constructing said track chain，by lapping the links thereof，so that the rollers shall have a constant bearing on the three plates which form two succeeding links，and break joint with each other，as clear ly represented．
To C．H．Parker，of New Geneva，Pa．，for improve ment in bedstead fastenings．
I claim the device for securing the ends of the rails to the posts，consisting of a headed tenon on the rail and two wedged shaped，and dovetailed boxes in the post，the latter held in place by the pendent arms and tie－rods by which the mattress is stretched，substantially as herein set forth．
To W．F．Ressegine，of Cincinnati，Ohio，for im provement in spring mattresses．
I claim the construction of the jointed spring mattress，substantially as set forth in the spe cification．
To E．S．Snyder，of Charlestown，Va．，for improve－

## ont in threshing machines．

I claim first，surrounding the twisted wings with an imperforated case and placing the same inside the threshing cylinder－the whole revolving together in the manner and for the purpose set forth．
Second，constructing the concave of adjus－ tive star or other shaped teeth attached to rods fastened to the frame，substantially as descri－ bed and set forth in the specification．
Disclaimer．－I am aware that such teeth have been used in the throat of feeding apparatus of a corn sheller to aid in feeding， and thereof I only claim them when used for the rubbing surface of the concave．
Third，placing the curved spring rack be－ tween the concave of adjustive teeth，and the vibrating separator，in the manner and for the purpose described．
To J．Stevens，of Middletown，Md，for arrangemen I claim thaps
I claim the arrangement of the mirrors，sub stantially in the manner and for the purpose set forth．
To J．A．Woodbury，of Boston，Mass，for improve－ ment in planes for tonguing and grooving boards，\＆o．
I claim the combination of a gouge or goag I claim the combination of a gouge or goag－
es，（for removing the bulk or greater portion of a shaving in forming tongues or grooves in boards or planks）with smoothing tools having a chisel edge，a cutting and side lip on either， or both sides thereof，（for smoothing sides and bottom of the grooves，and the edges about the tongues，as set forth；）said gouges being set in front of said smoothing tools，and the tially，as herein above set forth．
re－issues．
To G．Spafford，of Windham，Conn．，deceased，（as－ signor to J．Campbell，of New York，N．Y．，）for im rags for manufacturing paper．Patented Sept．21st， 1840．Re－issued June 11， 1850 ．
What is claimed，is the herein before descri－ bed process of preparing materials for making pulp in the manufacure of paper by digesting them in a turning vessel with an alkaline so－
lution or other liquid，the heat being applied to the outside of the vessel or by steam in－ troduced with in it substantially as herein se forth．
jesigns．
To A．Paul，of South New Market，N．H．，for design for stoves．
I claim the combination of the bull＇s eyes in alto relievo（having radial notches as de－ scribed）and of alternating concave and con－ vex，radial ribs and surrounding mouldings， on the several doors and pannels of the front and side plates，and the row of pointed levers， and of alternate notches and ridges，\＆c．，on the moulding of the hearth plate，all as herein ings．

Great Eronautic Enterprise．
＂It is with feelings of pride and heartfelt pleasure we are enable to state that two bal oons，one fifty feet inits greatest diameter and from thirty to forty in its transverse；and the other of a smaller size，are being construct－ ed in our city under the immediate personal Wise．Th of the distinguished ※hich has hith erto attended Wise＇s Eronautic experiments has induced him to engage in this，his greatest， with the confident hope that it will enable him o prove not only the practicability and safe ty of Erial Navigation，but also the ability to steer and propel balloons in any desired di－ ection．
The two balloons will contain over 1500 yards of silk，a nd the capacity of the largest will be sufficient to enable Mr．Wise to take with him six passengers at least，in his ærial voyages，as it will contain 30,000 cubic feet of gas，with an ascensive power of 70 lbs ．to the 1,000 feet．By this means parties of pleasure and invalids，will have an opportunity of test－ ing the pure air of the upper regions，while to the man of science it will open a boundless field，hitherto wholly inaccessible save to a favored few．In order that the safety of an ascension may be fully apparent，the Balloon will be permitted to rise several hundred，or over a thousand feet，and be made to descend at the pleasure of the voyagers by means of a cord and windlass．Where it is desired，Mr Wise will take excursions of 500 or 1,000 miles，without any of the appliances forde－ centatpleasure butthose usually employed by Æronauts－the valve，\＆c．
By these lengthly excursions，say from Cin cinnati or St．Louis to the Atlantic Seaboard he wishes to demonstrate the entire feasibility of crossing the Atlantic Ocean，and circum navigating the entire Globe．Nor is this all， Mr．Wise has always contended for the prac－ ticability of steering and propelling balloons in any direction．The smaller of the two bal－ loons now constructiag is designed to aid him in proving the truthfulness of this theory．－ Our slight knowledge of Æronautics will not nable us to explain by what means he pro－ poses effecting this，but the ：very confiden manner in which he asserts his ability to do it satisfies us that it can be done．In his re－ ently published，and highly interesting work， he has most clearely demonstrated the pos－ sibility of＂varying at will，from a straight course，thirty or forty degrees from the la titude of departure．＂Should he succeed，as we have no doubt he will，what mighty results must

## follow his success．

Mr ．Wise is now negotiating with Mr．Paine， of Worcester，for the use of one of his＂Mag－ netic Decomposers，＂by which water is rapidly onverted into its gaseous elements．As th ascensive power of the gas thus obtained is much greater than that hitherto used in bal－ ooning，the operation will be greately facilitat d by the use of Mr．P．＇s apparatus．
The enterprise has been undertaken by five scientific gentlemen of our city，including Mr Wise．Too much praise cannot be awarded hem for the noble stand they have take on he side of science．The cost of the two bal loons now constructing will exceed $\$ 3,000$ ， and we have been informed by Mr．W．，that one sufficiently large and safe to cross the ocean and circumnavigate the Globe would cost about ten thousand dollars．Such an one， his company propose ultimately constructing in order that our country may take the lead in Æronautic Science and adventure，as she is fast doing in almost every other department． We shall note from time to time，the progress of the enterprise，and keep our readers duly advised of it．＂
［We take the above from our cotempo－ ary，the Lancaster（Pa．）Gazette．It will how that our intrepid friend John Wise is bound to show the world something new in bal－ ooning．If any man can make the balloon go， and go succesfully，he is the one．We would ．ke to hear from himin relation to his negoti－ ation about Mr．Paine＇s apparatus．

Petition for the Extension of a Patent．
Edward M．Chaffee，of New Brunswick，New ersey，has applied for an extension of his pa
tent for an improvement in the manufacture of India rubber．The petition will be heard on the 5th day of next August，at the Patent Of－ fice．The patent expires on the 31st August．

## English Estimate of American Clocks．

The following extract from a late work on clock and watch making，by Edmund Beckett Denison，will exhibit the effect in England of ne branch of American manufactures
＂The bracket clocks with pendulums from 10 to 18 inches long，are now almost the only English clocks（except regulators）that find any sale．These，when well made with a fu－ see，and not exposed to a temperature that freezes the oil，（which is much above the freez－ ing point of water，）will go nearly as well as coarsely made long clock of the old fashion－ ed kind．Sometimes they require a good deal of trouble to set them so as to beat equally； or if they are not set，they are very likely to stop，as they have generally，and the foreign nes always，have very little force to spare．
Even they are getting fast superseded by the atter class of American clocks，and French ornamental clocks，neither of which，however， will last nearly so long．With the latter it is no doubt quite hopeless for us to compete，as， besides the great cheapness of their labor，the French appear to possess what I may call a smaller eye and finger than English workmen， and they are able to perform dilicate and orna． mental work with much greater quickness and facility．And as those who chiefiy regard the beauty of the figure of their elocks seldom are muchabout their entrails，they consider it of no consequence that a good English clock is better for the natural object of a clock than foreign one．Whether it would bepossible to manufacture clocks on a large scale as cheap as the American ones，I am not able judge．I have been told that，but for the cases it would． But unless the English clockmakers take some teps towards either altering the kind of clocks hat they make，or can find out some cheaper mode of making them，there is no doubt that here will soon be no house clocks，except reg－ ulators，made in this country．The old－ ashioned，full length house clock is now near－ y exploded，on zccount of its ugliness，size，and dearness，as compared with the American clocks，which go sufficiently well for ordinary purchasers．
No one who has seen the inside of an Amer－ ican clock can help seeing that ours are unne－ cessarily heavy，and waste a great deal of the force in merely ovecoming their inertia and friction．An Americanclock goes a week with oth the weight and the fall for it，not half of what they are in the common English clocks； and as a large pendulum requires no more force to keep it going than a small one，it is evident that about ${ }^{\text {tiths }}$ of the moving power in our locks is wasted．（The commendation of the American clocks cannot be extended to the fix－ ing of their pendulums，which is bad as possi－ ble．）I have also seen some very neat French locks，about the same size as the American but much more highly finished，and with dead scapements，going a week with a very small weight．＂

## Patent Case－－Hay Press．

Before Judge Nelson in the United States Circuit Court，New York．－Nichs．J．Lampman against V．P．Adams，for an alleged infringe－ ment of a patent for an improvement on a ma－ chine for pressing hay．The defence was，an abandonment of the invention to the public． The press considered an infringement，wa＇s made nearly two years before the patent was granted；but application for the patent was made before the machine．The verdict was given for the plaintiff on last Thursday，the 1th．Damages，$\$ 10$ ．Geo．Giff ord for plain． tiff ；A．L．Jordan for defendant．

## Index to Patents．

Mr．Davis，of Mississippi，submitted to the following resolution to the Senate last week， and it was adopted：
Resolved，That the Committee on Patents and the Patent Office be instructed to inquire into the propriety of causing to be prepared and published arr analytical index of the pa－ ents which have been granted by the United States，to promote the progress of science and States，to promo
the useful arts．
