upon it, indicates the minimum of durability. | lbs. one foot high, whereas one grain of zinc teen and a quarter pounds. The whole of this act of tamping the sand. Itstruck him on the left cheek just behind and below the mouth, was picked up by the workmen, "covered with blood and brains," several rods behind where scorched, was prostrated, apparently less by the blow of the iron than the force of the explosion. He fell on his back, gave a few convulsive twitches of the extremities, but "spoke in a few minutes." His men placed him in an ox cart, in which he rode three quarters of a mile to his lodgings, sitting erect; got out of the cart himself, and with but little assistance; walked to the piazza and afterwards up stairs, talking rationally to the physicians and giving them a clearer account of the accident than his friends could; occasionally vomiting hage from the wound, with the actual loss of a considerable portion of the substance of the brain. The left eye was dull and glassy, but was sensible to the impression of light. Gage bore his sufferings with heroic fortitude, telling Dr. Williams, "here is business for you," and expressing to Dr. Harlow the hope that

"he was notmuch hurt." For the first ten days everything went on well, Gage being, with some intervals of natural delirium from fever, pretty rational and hopeful; that, at the close of this period, he lost the sight of the left eye, and lay for nearly a fortnight in a semi-comatose state or partial COVERING .- The planks having been pro- producing by induction a magnetic force, this thor is informed that Jacobi observed it. And stupor; that he then began to improve in body and mind; was, within two months, walking about in the street, in defiance of instructions; suffered a relapse in consequence; and, final-
