NEW YORK, AUGUST 31, 1850.

Improvements in Railroad Travelling, So far as ease and comfort are concerned, travelling by steamboat is altogether superior to railway locomotion. There are somethings, however, about railroads, which incline us to give them the preference. The majority of steamboats have generally been and are managed to give the public a very unfavorable opinion of the amount of honesty engaged in their management. The fares between two different places, are generally regulated by a sliding scale of such rapid and extensive variation, that it is not easy to tell what may be to-morrow from what is to-day. Railways are managed by single companies, whose charges are uniform from one ond of the year to the other, and not like the steamboats,-"fickle as the winds, the water, or the weather." The trickery of changeable fares in steamboats have enlisted the feelings of thousands in favor of railways, who otherwise would prefer the steamboat. In the steamboat, passengers can sit, walk, talk, read, sleep and enjoy the cool and refreshing breeze which comes rippling over the dancing waters. In the railroad car they are crowded, shaken, smoked and baken,-ease and comfort are out of the question. But who does not like rapidity in travel? And who would not sacrifice a few hours of ease for the saving of a few hours of time? We never commence a journey, however rapid the conveyance, but the time appears to hang heavy until it is over. There is something exhiliarating in dashing along the railroad at the rate of thirty miles per hour, in comparison with the steamboat running at the rate of fifteen. The greatmass prefer to travel as fast as they can,-they like to be at the end of their journey as soon as possible. Railway passenger traffic will therefore increase, while steamboat interior travel will decrease. The comfort and safety of passengers on railways should therefore engage at all times, the attention of railway companies. On the engines there seems to be less room for improvement than on the tracks-the laying of the rails. On many roads these are laid down in a very slovenly manner, and when travelling over them at the rate of twenty-five miles per hour, they give a person, by the jolting and heaving operation which he undergoes, a very good idea of a storm at sea in miniature. To increase the comfort of railway travelling, there is much yet to be done. We have some good railroads, but we might name not a few which are dis graceful to their companies.

There is one great improvement, viz., getting rid of coal smoke and dust on railways, to which special attention should be directed. The atmosphere of a railroad car contains a great amount of carbonic acid which comes direct from the locomotive. Sparks also, in spite of many different kinds of spark arres tors, not unfrequently, but quite commonly, come whisking into the cars in disgraceful showers, without respect to judge or jury.

We hope that the anthracite burning loco motive will soon supersede the wood burning one, or that coke will be made so as to supersede economically the use of either wood or hard coal.

Good solid tracks, and the absence of smoke and sparks, would add fifty per cent. to the comforts of railway travelling. Some of our roads need noreform in the first case, but assuredly all do, the latter evil.

Mechanics' Fair.

The Massachusetts Charitable Mechanics Association will hold their Annual Exhibition of American Manufactures from the 16th to the 20th of September, in Boston. J. S. Skinner, Esq., Editor of "The Plow, the Loom, and the Anvil," is to deliver the Annual Address.

Among the memoirs recorded at a recent iliary to the direction of balloons.

machine, invented by Mr. Blaikie, of the firm useful arts, has been the means of conferring of Blaikie and Cameron, Stockwell Street, untold benefits upon all classes, and upon none which, when brought into full operation, bids more than the agricultural. Gilbert Burns, fair to surpersede the old reaping-hook completely. Like nearly all effective discoveries, its principle is simple. Two steel blades, perfectly sharpened, meet at a certain angle in front of something like a carriage break for horses. In the centre of this carriage there is a seat for the director of this machine, who. by a simple apparatus, turns the blades in any direction he pleases. To avoid contact with uneven ground, a small turn upward, like the toe of a skate, finishes the blades; so that, meeting a rock or indurated soil, the cutter | is possible to apply it. passes over, and instantly falls into place again. The whole is put in motion by a horse, which pushes from behind, but does not draw as in the plow or harrow. The model we saw has been tried on rushes, grass, and besides cutting down, it is so constructed that it "lays over" as cleanly as the scythe or the hand with the hook, and it cuts such a quantity as would puzzle half-a-dozen hard working men to encounter in a similar time. The principle is obviously good; and, to our notion, it only requires a fair trial in application to

Agricultural Machinery

have it ranked at its full value. [The above is taken from the "Glasgow of manual labor is so high that ingenuity has been taxed to the utmost in inventing machinumerous are our churns, rakes, plows, horsepower, grain separators, cultivators, &c, and portions of water banks subject to disintegra-Great Britain all the grain is reaped with the sickle. In the harvest season it is no uncomand board-not so bad pay, but the labor is still be standing as it stood of yore, and more could be carried out, for labor is both scarce and high, according to the price of agricultural products; it is therefore for the American farmer's interests to have as many labor saving machines as possible, and those of the very best quality. They should be strong, simple, and easily repaired. We have seen a great number of agricultural implements on which a great deal of ingenuity was expended, but which, from their very complexity, we could not but condemn. It is no easy matter for a farmer who lives some distance from a machine shop, to go and get a broken instrument repaired. He therefore should have duplicates of the various breakable parts always on hand, to replace at once a broken one.-Supposing a farmer is threshing his grain, and one of the wheels of the machine should break, and not another within a mile to replace it, why he would lose two or three dollars, taking all things into consideration, for his neglect. We have seen some farmers great upon making a little show, with a fine carriage and harness, and who had only one plow, a poor harrow, and but a scanty share of other implements. In every case this is poor policy; good stock in cattle and the best of agricultural implements, are signs of wisdom, thrift and comfart The farmer w things sows his own thistles. Every farmer should have a machine house in which to keep his implements under cover, when not in use. All tools should be kept clean and free should be greased when laid up for winter. The farmer who has a small stream of water might saw his wood, churn, thresh, and per- were sixty cases depending on this decision.

provements in machinery, and the application We have seen the model of a new reaping of it as a substitute for a manual labor in the the brother of the poet, expressed himself once in respect to the "threshing machine" as follows: "it has raised the rural peasantry of Scotland from serfs, in the drudgery of a disagreeable labor, to men;" and we can safely say the same thing of other kinds of machinery; and that farmer exhibits the greatest amount of good sense who studiously endeavors to lessen the manual toil of himself and his family, by the employment of good machinery as a substitute, in every case where it

Ocean Encroachments.

In 1806 the old Atlantic House, at Cape May, was 334 feet from the sea. In 1829 the bank was washed away up to the house, which had to be moved back; thus the sea gained several other materials of that sort, and on the land 13.2 inches on an average every answers the purpose exceedingly well. In the year. In 1847 about 40 feet was washed displayed there by the inhabitants of every corn or hay field its value is evident; for, | away, which so alarmed-as well it mightthose holding property on the bank as to compel them to plant a double row of stakes below the bank and fill it in with brushwood and litter. This has prevented the water from undermining the bank, and not a foot of it has been washed away since then. This hint should not be overlooked by those who have property on disintegrating banks of seas, lakes and rivers. Opposite the city of Albany, in Daily Mail," (Scotland.) We extract it to Greenbush, on the Hudson river, there is a make a few remarks thereon. We believe the continual washing away of a portion of the Americans are ahead of all other nations for; bank. At a great expense a portion of it has variety in agricultural implements. The price been faced with a water wall, but still there is this advancement and promulgation (so far as some of it exposed. A double row of stakes every five years, (if required even in that time) nery to save paying for manual toil. How will preserve the bank and save the valuable property behind it. If not carefully protected, we have not a few reaping machines. In | tion by the water, are liable to receive more damage at one time than another, like the firm reliance upon the public for future engreat crevasse which occurred last spring at mon thing to see three hundred men and wo- New Orleans. The only way to prevent such men reaping in one field. The majority of occurrences is to be prepared for them. If the these are Irish, who come to England and the people at Cape Island had sunk their simple east of Scotland, just to reap during the har- breakwater of double piles, brush, stones and vest. Their wages are about 621 cents per day, clay, in 1806, the old Atlantic House would very severe. In America no such system than 300 feet of valuable land along the bank would have been saved.

A Tall Chimney.

Cambridge, have erected a chimney 230 feet treated with respect. Those who write to us high. Its form is octagon, of brick, with a massive granite foundation of 36 feet in di- the patent, and give the name of the patentee. ameter. The base of the brick work is 25 feet Any useful information communicated, is rediameter, and the top 13 feet. There is a chimney within a chimney, the entire distance of seven feet diameter. Three horizontal flues, good education, but who from carelessness do from the furnaces, are carried in beneath to not take the laconic trouble of condensing their the perpendicular one, though so constucted that additional flues, if necessary, may be to publish. added. Thus, through the one gigantic cone, all the smoke from the several furnaces of the establishment may be carried, which will render the group of smaller ones useless, and therefore be demolished. By this grand pro ject, East Cambridge will be relieved entirely of the smoke from the glass-houses, "a consummation devoutly to be wished." This structure has been erected under the superintendence of Mr. Wm. H. Pratt, of Boston, who has accomplished his great task in the most substantial and satisfactory manner. He informs us that 800,000 bricks, and one hundred cubic yards of granite were required in its erection.

The Great Case of the Parker Water Wheel

This case, which has been on trial for a long time, was decided last Monday. After a from moisture. The plow should always have long period of argument and much considea bright shear and mould board, and these ration, the injunctions asked for upon the ground of violation of the patent for Parker's water wheel were refused. Judge Grier, of next week. to drive a wheel of a few horse power near his the United States Circuit Court, delivered the house, should employ it for that purpose : it opinion of the Court to that effect. The publishers of the Scientific American respectfully inform their patrons, that they have matured their arrangements for the next volume, designing it to be the best of all the preceding five. They have contracted with a paper manufacturer for a superior and heavier kind of paper, on which it shall be printed. Our patrons will therefore have a hand somer paper than volume 5, and one more valuable, also, in respect to matter and illustration .---The publishers are happy to inform their patrons that they have employed an able correspondent, who is now dispatched to Europe, and who will correspond exclusively for the Scientific American during the Great Industrial Exhibition to be held in London next May. The said correspondent will communicate with the Scientific American semi-monthly, from the first of next December until May. 1851, and then he will correspond weekly. Thus we will be enabled to lay before our readers a clear review of the machinery, &c., nation in the world. It is the design of the publishers to keep the Scientific American in advance, as heretofore, of all other publications, in all that concerns inventions in machinery, discoveries in chemistry, &c., and it will furnish the clearest and most useful articles in every department of science and art, from the boiling of a tea-kettle to the operations of the most ponderous and complicated engines which guide the spindle and direct the loom. The discussion of party, political and religious questions, are foreign to our objects; our course is to treat of science and art, and to labor for we are able), from one end of the earth to the

Improvements in the Scientific Ameri.

can,

The Scientfic American has always received a firm support from all classes, and has uniformly been respected for its impartiality and soundness; the publishers therefore place a couragement.

other.

Advice to Correspondents.

When you write, be sure to place both the name of the place where you reside, and the State, either at the top or end of your letter. Do not write too long a letter, nor a hasty one. Write clear, and carefully, without many flourishes. Do not write on any vain and unreasonable subject, and always be reasonable yourself. If your letters are plain, reason-The New England Glass Company, at East able, and not too long, they will always be about patent claims should state the date of ceived with pleasure. We receive many communications from men who have received a ideas—such communications we are not able

Patent Case.

In next week's number we shall publish the able opinion of Judge Grier in the case of Blanchard vs. Reeves and others, delivered on the 8th of August. The report was prepared by our Philadelphia correspondent, and has never before appeared. It is quite important, and our readers may expect a feast of scientific reason rarely met with.

Telegraph Extension.

The St. Louis Reveille says it is probable that before the winter sets in, it will receive its news from the plains, Santa Fe, the mountains, &c., by telegraph from Independence. It appears that Messrs. Schaffner and Veitch have met with all the necessary encouragementalong the route, and are now actively engaged in pushing the work to completion.

Notice.

We have some very interesting communication, which are necessarily delayed until

There was frost at Bethlehem, N. Y., on the night of the 15th inst. The weather during the preceding three days was cold enough for
