# $\mathfrak{D C}_{\text {cientific }}$ anrexican 

NEW YORK，ALGEST 31， 1850

Improvements in Rallroad Travelling So far as ease and comfort are concerned travelling by steamboat is altogether superio to railway locomotion．There are some things however，about railroads，which incline us to give them the preference．The majority of steamboats have generally been and are ma－ naged to give the public a very unfavorable opinion of the amount of honesty engaged in their management．The fares between tw different places，are generally regulated by sliding scale of such rapid and extensive vari ation，that it is not easy to tell what may be to－morrow from what is to－day．Railways are managed by single companies，whose charges are uniform from one ond of the year to the other，and not like the steamboats， ＂fickle as the winds，the water，or the weath－ er．＂The trickery of changeable fares in steamboats have enlisted the feelings of thous ands in favor of railways，who otherwise would prefer the steamboat．In the steam boat，passengers can sit，walk，talk，read sleep and enjoy the cool and refreshing breeze which comes rippling over the dancing waters In the railroad car they are crowded，shaken， smoked and baken，－ease and comfort are out of the question．But who does not like rapid－ ity in travel？And who would not sacrifice a few hours of ease for the saving of a few hours of time？We never commence a jour ney，however rapid the conveyance，but the time appears to hang heavy until it is over． There is something exhiliarating in dashing along the railroad at the rate of thirty miles per hour，in comparison with the steamboat running at the rate of fifteen．The greatmass prefer to travel as fast as they can，－they lik to be at the end of their journey as soon as possible．Railway passenger traffic will there－ fore increase，while steamboat interior travel will decrease．The comfort and safety of passengers on railways should therefore en－ gage at all times，the attention of railway companies．On the engines there seems to be less room for improvement than on the tracks－the laying of the rails．On many roads these are laid down in a very slovenly manner，and when travelling over them at the rate of twenty－five miles per hour，they give a person，by the jolting and heaving operation which he undergoes，a very good idea of a storm at sea in miniature．To increase the comfort of railway travelling，there is much yet to be done．We have some good railroads， but we might name not a few which are dis raceful to their companies．
There is one great improvement，viz．，get ting rid of coal smoke and dust on railways，to which special attention should be directed． The atmosphere of a railroad car contains a great amount of carbonic acid which comes direct from the locomotive．Sparks also，in spite of many different kinds of spark arres tors，not unfrequently，but quite commonly， come whisking into the cars in disgracefu showers，without respect to judge or jury．
We hope that the anthracite burning loco－ motive will soon supersede the wood burning one，or that coke will be made so as to super－ ede enomically the use of either wood hard coal．
Good solid tracks，and the absence of smok and sparks，would add fifty per cent．to the comforts of railway travelling．Some of our roads need noreform in the first case，but as suredly all do，the latter evil．

## Mechantcs，Falr．

The Massachusetts Charitable Mechanics Association will hold their Annual Exhibition of American Manufactures from the 16 th to the 20th of September，in Boston．J．S．Skin ner，Esq．，Editor of＂The Plow，the Loom， and the Anvil，＂is to deliver the Annual Ad dress．

Among the memoirs recorded at a recent meeting of the Paris Academy of Sciences， was one on a method of rendering birds aux iliary to the direction of balloons

## Agrtcultural Machinery

 We have seen the model of a new reapin f Blaikie and Cameron，Stockwell Stre which，when brought ints full operation，bids fair to surpersede the old reaping－hook oom pletely．Like nearly all effective discoveries its principle is simple．Two steel blades， perfectly sharpened，meet at a certain angle in front of something like a carriage break fo horses．In the centre of this carriage there is seat for the director of this machine，who by a simple apparatus，turns the blades in any direction he pleases．To avoid contact with uneven ground，a small turn upward，like the toe of a skate，finishes the blades；so that， meeting a rock or indurated soil，the cutter passes over，and instantly falls into place again．The whole is put in motion by a horse，which pushes from behind，but does no draw as in the plow or harrow．The mode we saw has been tried on rushes，grass，and several other materials of that sort，and answers the purpose exceedingly well．In the corn or hay field its value is evident；for， besides cutting down，it is so constructed that it＂lays over＂as cleanly as the scythe or the hand with the hook，and it cuts such a quan－ ity as would puzzle half－a－dozen hard work－ ing men to encounter in a similar time．The principle is obviously good ；and，to our notion， it only requires a fair trial in application to have it ranked at its full value．［The above is taken from the＂Glasgow Daily Mail，＂（Scotland．）We extract it to make a few remarks thereon．We believe the Americans are ahead of all other nations for variety in agricultural implements．The price of manual labor is so high that ingenuity has been taxed to the utmost in inventing machi－ nery to save paying for manual toil．How numerous are our churns，rakes，plows，horse－ we haven Great Britain all the grain is reaped with the sickle．In the harvest season it is no uncom－ mon thing to see three hundred men and wo－ men reaping in one field．The majority of these are Irish，who come to England and the east of Scotland，just to reap during the har－ vest．Their wages are about $62 \frac{1}{2}$ cents per day， nd board－not so bad pay，but the labor is very severe．In America no such system could be carried out，for labor is both scarce and high，according to the price of agri－ cultural products ；it is therefore for the Ame－ rican farmer＇s interests to have as many labor saving machines as possible，and those of the very best quality．They should be strong， simple，and easily repaired．We have seen a reat number of agricultural implements on which a great deal of ingenuity was expend－ ed，but which，from their very complexity，we could not but condemn．It is no easy matter or a farmer who lives some distance from a machine shop，to go and get a broken instru－ ment repaired．He therefore should have du－ plicates of the various breakable parts always n hand，to replace at once a broken one．－ Supposing a farmer is threshing his grain，and one of the wheels of the machine should break， and not another within a mile to replace it， why he would lose two or three dollars，taking all things into consideration，for his neglect． We have seen some farmers great upon ma－ king a little show，with a fine carriage and harness，and who had only one plow，a poor harrow，and but a scanty share of other im－ plements．In every case this is poor policy ； good stock in cattle and the best of agricul－ ural implements，are signs of wisdom，thrift and comfert．The farmer who neglects these things sows his own thistles．Every farmer should have a machine house in which to seep his implements under cover，when not in use．All tools should be kept clean and free rom moisture．The plow should always have bright shear and mould board，and these should be greased when laid up for winter． The farmer who has a small stream of water to drive a wheel of a few horse power near his house，should employ it for that purpose ：it might saw his wood，churn，thresh，and per－ form a great number of operations．Every farmer should at least have a good horse－pow－
provements in machinery，and the application of it as a substitute for a manual labor in the useful arts，has been the means of conferring untold benefits upon all classes，and upon none more than the agricultural．Gilbert Burns， the brother of the poet，expressed himself once respect to the＂threshing machine＂as fol－ ows：＂it has raised the rural peasantry of Scotland from serfs，in the drudgery of a dis－ agreeable labor，to men；＂and we can safely say the same thing of other kinds of machi－ nery；and that farmer exhibits the greatest mount of good sense who studiously endea－ vors to lessen the manual toil of himself and his family，by the employment of good ma－ chinery as a substitute，in every case where it is possible to apply it．

## Ocean Encroachments．

In 1806 the old Atlantic House，at Cape May，was 334 feet from the sea．In 1829 the bank was washed away up to the house，which had to be moved back；thus the sea gained on the land 13.2 inches on an average every year．In 1847 about 40 feet was washed away，which so alarmed－as well it might－ those holding property on the bank as to com－ pel them to plant a double row of stakes be－ low the bank and fill it in with brushwood and litter．This has prevented the water from un－ dermining the bank，and not a foot of it has been washed away since then．This hint should not be overlooked by those who have property on disintegrating banks of seas，lakes and rivers．Opposite the city of Albany，in Greenbush，on the Hudson river，there is a continual washing away of a portion of the bank．At a great expense a portion of it has been faced with a water wall，but still there is some of it exposed．A double row of stakes every five years，（if required even in that time） will preserve the bank and save the valuable property behind it．If not carefully protected， portions of water banks subject to disintegra－ tion by the water，are liable to receive more damage at one time than another，like the great crevasse which occurred last spring at New Orleans．The only way to prevent such occurrences is to be prepared for them．If the people at Cape Island had sunk their simple breakwater of double piles，brush，stones and clay，in 1806 ，the old Atlantic House would still be standing as it stood of yore，and more than 300 feet of valuable land along the bank would have been saved．

## A Tall Chimney．

The New England Glass Company，at East Cambridge，have erected a chimney 230 feet high．Its form is octagon，of brick，with a massive granite toundation of 36 feet in di－ ameter．The base of the brick work is 25 feet diameter，and the top 13 feet．There is a chimney within a chimney，the entire distance of seven feet diameter．Three horizontal flues， from the furnaces，are carried in beneath to the perpendicular one，though so constucted that additional flues，if necessary，may be added．Thus，through the one gigantic cone， all the smoke from the several furnaces of the establishment may be carried，which will ren der the group of smaller ones useless，and therefore be demolished．By this grand pro ject，East Cambridge will be relieved entirely of the smoke from the glass－houses，＂a con－ summation devoutly to be wished．＂This structure has been erected under the superin tendence of Mr．Wm．H．Pratt，of Boston who has accomplished his great task in the most substantial and satisfactory manner． He informs us that 800,000 bricks，and one hun－ dred cubic yards of granite were required in its erection．

## Wheel

This case，which has been on trial for ong time，was decided last Monday．After a long period of argument and much conside－ ration，the injunctions asked for upon the ground of violation of the patent for Parker＇s water wheel were refused．Judge Grier，of pinion of Circuit Court，delivered th were sixty cases depending on this decision． For Complainant－Titus，Cadwalader and St．G．Campbell．For Respondent－Mallery，
Penrose，and Wm．W．Hubbell．

The publishers of the Scientific American respectfully inform their patrons，that they have matured their arrangements for the next volume，designing it to be the best of all the preceding five．They have contracted with a paper manufacturer for a superior and heavier kind of paper，on which it shall be printed． Our patrons will therefore have a hand somer paper than volume 5 ，and one more valuable， also，in respect to matter and illustration．－ The publishers are happy to inform their pa－ trons that they have employed an able corres－ pondent，who is now dispatched to Europe and who will correspond exclusively for the Scientific American during the Great Indus－ trial Exhibition to be held in London next May．The said correspondent will communi－ cate with the Scientific American semi－month－ ly ，from the first of next December until May， 1851，and then he will correspond weekly Thus we will be enabled to lay before our read－ ers a clear review of the machinery，\＆c．， displayed there by the inhabitants of every nation in the world．It is the design of the publishers to keep the Scientific American in advance，as heretofore，of all other publica－ tions，in all that concerns inventions in machi－ nery，discoveries in chemistry，\＆c．，and it will furnish the clearest and most useful articles in every department of science and art，from the boiling of a tea－kettle to the operations of the most ponderous and complicated engine which guide the spindle and direct the loom The discussion of party，political and religious questions，are foreign to our objects；our cours is to treat of science and art，and to labor for his advancement and promulgation（so far as we are able），from one end of the earth to the other．
The Scientfic American has always received a firm support from all classes，and has uni－ formly been respected for its impartiality and soundness；the publishers therefore place a frm reliance upon the public for future en

Advice to Correaponients．
When you write，be sure to place both the name of the place where you reside，and the State，either at the top or end of your letter． Do not write too long a letter，nor a hasty one．Write clear，and carefully，without ma－ ny flourishes．Do not write on any vain and unreasonable subject，and always be reasona ble yourself．If your letters are plain，reason． able，and not too long，they will always be treated with respect．Those who write to us about patent claims should state the date of the patent，and give the name of the patentee Any useful information communicated，is re－ ceived with pleasure．We receive many com－ munications from men who have received good education，but who from carelessness do not take the laconic trouble of condensing their deas－suoh communications we are not able to publish．

Patent Case．
In next week＇s number we shall publish the able opinion of Judge Grier in the case of Blanchard vs．Reeves and others，delivered on he 8th of August．The report was prepared by our Philadelphia correspondent，and has never before appeared．It is quite important and our readers may expect a feast of scienti－ ic reason rarely met with．

Telegraph Extension．
The St．Louis Reveille says it is probable that before the winter sets in，it will receive its news from the plains，Santa Fe，the moun－ tains，\＆c．，by telegraph from Independence． It appears that Messrs．Schaffner and Veitch have met with all the necessary encourage－ ment along the route，and are now actively engaged in pushing the work to completion．

Notice．
We have some very interesting communi－ cation，which are necessariiy delayed until

There was frost at Bethlehem，N．Y．，on the night of the 15 th inst．The weather during he preceding three days was cold enough for ［We sat by one of the fires－comfortable it was．］
