NEW YORK, DECEMBER 28, 1850.

The Supply of Cities and Villages with Good Water.

The subject we have chosen for making a few remarks, is one of vast importance. Fire, air, food, and water are essential necessaries of life. In some climates fire might be dispensed with, but in no country or climate can any man dispense with either one of the triune necessaries, and live. Water is so essential to health and happiness, that its first and paramount claims relate to its uses as a supporter of life. We cannot eat a meal but wa. ter forms seven-eighths of it, and we cannot inhale a breath but it is moistened with two bodies are composed of seven-eighths of water, and a knowledge of this fact gives us some insight into the causes of those terrible deliriums and excruciating torments which men are reported to have suffered, who have been long deprived of its use.

water which man needs should be pure-the fact is self-evident to any man who has eves to see, ears to hear, or sense to taste. The prince, surrounded with all the other luxuries recommended) let it be done on such parts as of the world, if deprived of good water, would 'are known to be old, and on which they expect be poor indeed-the hardy mountaineer of the to base no claims. Alleghanies, who quaffs the cool draught from the bosom of his native rocks, and with only | rule be followed in describing the machine, or corn-cake for his simple repast, would be wealthier than he.

The inhabitants of cities, villages, or districts supplied with plenty of good water, are superior in robustness, health,-in fact, in every respect, to those who live in places destitute of such blessings.

Owing to a few enquiries made of us, lately, about Artesian Wells, we presume that what we have to say upon the supply of water, will be of some interest. There are four methods of suppling cities, villages, and houses with water: one is by common wells, or artesian; the second by river water conveyed from a higher to a lower level; the third, by forcing river water, by steam or water power, from a lower to a higher level; the fourth, by collecting water over an extended surface, and conveying it by gravitation (from a higher to a lower level.) Another plan is, for domestic supply, by collecting rain water in cisterns. It is not possible to lay down any empiric rules for supplying all places in the best manner-that depends in a great measure on locality, but we wish to call attention to one plan, which has been triumphantly carried out | year rejected. in this city, and which is now becoming better understood, and coming into more general favor in the old world : we allude to the collecting of water into dams, and supplying it by gravitation.

Dr. Lee, of the Southern Cultivator, states, policy to have the application properly prepathat on every acre of vacant land. near red before submitting the case to the Patent Charleston, S. C., there falls 825,000 gallons of water per year, according to the rain gauge. Office. Cheap Postage. Here, then, is a source of water supply, from the heavens above, which those who cannot The Cheap Postage Bill is now before Conget it from the earth beneath, should avail gress, and we hope it will be passed and bethemselves of. Other places have the same come a law, not in a few weeks, but days. By source of supply, but to take advantage of the the debates in Congress, the proposed reducsame, it must be collected in such a situation tion of postage to 3 cents prepaid upon all as to run down hill, (supply those who want letters to whatever distance, appears to meet it by gravitation.) Another thing is, to colwith great opposition from some. It is said lect it; for it will soak away through the by one, that the reduction will injure the reearth, or disappear by evaporation, unless proipts of the post office, and that it will not per means are adopted to save it. The best be able to support itself, and it is argued by way to collect and save it, is to have the gath- another, that in that case it will become a burering grounds composed of an upper stratum | den to the general government, whereas in all of sand or mould, and an under-stratum of cases it should be self-supporting. These arclay; and to have deep dams and reservoirs to guments betray a great amount of ignorance contain it. This plan is fast supplanting ar-'in Post Office experience. The reduction of tesian wells in many places in the old world, our postage fees from 25 to 10 cents, and from for it has been found, that the water collected in this manner is purer and much better than venues, and the reduction in England from s it respects the ability of Congress to frame that derived from deep wells. sand and clay, the lime will be detained in [ denied the blessings of copious showers.

Hints to Inventors.

There is no professional business, we believe, in which more skill and a thorough understanding of general mechanical matters is necessary, than in conducting applications for American patents.

We often hear inventors complaining of the injustice of the Patent Office in having rejected some alleged invention which the applicant had supposed to be new, and which, peror three per cent. of the same element; our haps, in itself, did possess some novelty, but which the inventor had failed to properly set forth in his drawings and specification.

Inventors who apply for patents themselves, who make their own drawings and specifications, should not overlook some important facts, which they are too liable to do. They It requires no argument to prove that the should represent, specifically, in their drawings, such parts of their improvements as they deem of the most importance; and if they slight the execution of any part (which is not

> In preparing the specification, let the same whatever apparatus it is, as is recommended in preparing the drawings. It is necessary that the nature of an invention be first described in the specification, and then explain its skilful men, and why not decide patent cases operation, referring to letters on the drawings; | on the same evidence? If the argument, that the same letters should, in all cases, refer to the same parts.

> After you have fully described, in your specification, how your improvement or machine is to be used, you come to the most important and difficult part of the whole matter,-that is, the basing of your claims, which should be | patent shall be entitled to a scire facias, to be done with very great care. The claims to an served on the patentee, to show the validity of invention are on what rests the whole or chief security, and therefore, they should not be made too broad, nor framed so ambiguously as the courts of law were not the best qualified not to cover all that is patentable in plain phraseology; it requires great mechanical skill, as well as a thorough knowledge of what Kane, of Philadelphia, to sustain him. He exists of a similar kind, in order to correctly frame a specification and make the claims, | ted body to frame patent laws. and, we believe, it is owing to the fact, that so many furnish the Patent Office with imperfect drawings and specifications, that such a multitude of applications for patents are every

If the price was reduced to ten cents, we believe that it would increase the Post Office revenues on both sides of the water.

### Reform of the Patent Laws.

IN SENATE .- The Bill to amend the Patent Laws, which was introduced last Session, was greatly amended and re-committed to the Committee on Patents. After being left over, the Committee, on last Thursday, the 19th, reported the amended bill back, with several amendments, which produced the following discussion :-

Mr. Turney moved to amend the amendments of the committee.

Mr. Jefferson Davis was apposed to the trial of patent cases before the ordinary judical tribunals. He was in favor of establishing a special court to try patent cases, where the whole points involved were those of nice scientific distinctions. At the proper time he would offer a substitute for the bill.

Mr. Turney said that courts of law were as competent to try patent cases as they were to try murder cases-where death was occasioned by poison, or by steamboat explosions on account of defects in the machinery. In these cases chemists are called in to analyse the alleged poison, or men of science to give their opinion as to machinery. The courts, bar, and jury deside these cases on the opinions of such courts of law were not competent to try patent cases, was sound, why would it not apply as well to the Senate? Why were they competent to pass patent laws? The immediate amendment before the Senate was, that each defendant in a suit for infringement of a his patent.

Mr. Jefferson Davis replied to show that to try patent cases on the same evidence, and cited the authorty of Judge Story and Judge did not think Congress was the best constitu-

Mr. Turney replied.

Mr. Seward said he understood the amendment now pending was to effect that, when a patentee should sue any one for infringement of his patent, the defendant might sue out scire facias, to try the validity of the patent, and that the original suit should be stayed till the scire facias was tried. In either case, the validity of patents was involved, and would be tried; and he could see no justice in , making the patentee the defendant, instead of plaintiff. Instead of the number of suits being decreased, they would be doubled: for every defendant, when sued, could have his writ of scire facias. If the Circuit Court of one district were to decide for or against the validity of a patent, that judgement would not be conclusive or final in other districts, as between other parties on the same patent another would be introduced.

was agreed to.

We go for a universal reduction of postage our Judges set themselves up to be the sole little. Some of our Judges have made very singular decisions. We do not like Mr. Turney's last amendment, but we have not room to say anything more about it this week.

> If the writ of scire facias be as Mr. Seward has stated it to be, then we don't like it, but we apprehend that it is altogether a different affair from the light in which it is presented by him, and will give our views on it next week.

#### -----Explosion of Steam Boilers.

Scarcely a week, yea, scarcely a day passes over our heads without our hearing of some terble calamity, caused by the bursting of a steam boiler. Last week we heard of the death of one well known among us-Alfred Stillman, of the Novelty Works. He was killed by the explosion of the steamer Anglo Norman, the boiler of which exploded at New Orleans, as mentioned by us last week. It is a terrible thing to be recording so much destruction of life every few weeks, by such means as explosions. The causes of explosions are well known, there is no secrecy or phenomenon about them. They can be prevented, just as certainly as the sun shines, were the means resorted to for that purpose. How seldom do we hear of explosions in England; how seldom in our Eastern States, how common on the Mississippi. The high pressure non-condensing steamers on that river, are like so many floating powder magazines. The most skillful engineers do not seem to prevent explosions; in fact, the majority of engineers who have fallen victims to explosions, have been men of practical experience. Continual exposure to danger, not only leads men to be fearless of it, but reckless also. There is no real safety apart from a low pressure condensing engine; at least we think that 40 lbs. pressure, in large boilers, as high as the law should allow any boat to carry. We know that the shallowness of the Ohio, and the great amount of earthy matter in the waters of the Mississippi, may be urged as strong objections to practicability of condensing engines, with their heavy machinery, but surely something should be done beyond mere talk. We have given our opinion; who will provide a better one to remove the evil?

## New Year's Presents.

It is customary with many employers to give their apprentices holiday presents : the custom is one of the good old times-we like it. Gifts, however, are often very injudiciously bestowed. We do not merely allude to that absurd custom of giving young people toysbut in bestowing any gifts which have no reference to the solid benefit of those to whom they are given. Books are common holiday presents-mone are better, if the books are good; and it is in reference to literary presents that we would say a few words. Every year we have had orders from a number of employers for the Scientific American, to be given as presents, along with some gifts of drawinginstruments, books, &c., to their apprentices ;they made their apprentices subscribers, thus encouraging a true taste for their business, and adopting the best possible way to feed the appetite, viz., sending home the ScientificAmerright. He was opposed to the bill, and hoped ican to be read every week for a year. A great deal of good, we have been informed, has been Mr. Turney rejoined, and the amendment done in this way. We make these remarks, merely, to call attention to the fact-the rea-Mr. Turney offered an amendment, making le fact, of such a present as making an certified copics of specifications granted in apprentice or son a subscriber to the Scientific foreign countries, receivable in evidence on American doing a great amount of good at a trial of all cases for infringement.-Agreed to. trifling expense. Nothing but the soundest moral Mr. Jefferson Davis offered a substitute for sentiments find their way into our columns, and the whole bill.—Laid on the table. it never shall be otherwise.
