Cotton.

The following remarks relative to this very important question, are condensed from the Manchester (Eng.) Examiner, and are the and the mixture will make a more brittle fabmost sensible of any that we have seen in any cotemporary :-

"It is not necessary only that it should be proved that flax may be mixed with cotton, or worked alone in cotton machinery, but it must be shown that flax so prepared can be afforded at a price so low as to compete with cotton when the American season yields a fair average crop. It is quite possible that flax may be worked to a slight advantage with fair cotton at 8d. per lb., and yet that it could not be so worked if cotton fell below 7d per lb. If flax cost the spinner 7d per lb., there would be no inducement to use it so long as cotton did not rise higher than 7d. The question of the price is then all important, and on this point we have endeavored to obtain some information. We understand that the price of flax in the straw is about £4 (\$19,40) per ton, or something less than one half-penny per lb. Three tons of the straw are estimated to make about five cwt. of clean fibre by the existing process; but it is calculated that by the improved methods adopted by Mr. Claussen, at least 6 cwt. will be obtained, and that this can be produced ready for the blower or scutcher in a cotton mill at a cost of 2gd., or not exceeding 3d per lb. It will be seen that in addition to this, there will be a great saving in loss or waste, as compared with cotton, because when the flax enters the blower it will have been already thoroughly cleaned, and cannot lose anything in the process of working beyond some of the finest and lightest fibre.

Besides the question of price, there is also the question of quantity. It may be said i flax be introduced into cotton mills, it will at once become dearer, from the increased demand for it, and the whole advantage from its supposed cheapness, as compared with cotton, will disappear. At first sight this seems to be the case; but a little exam ination will serve to dispel any great fear on this point. From a Parliamentary return now before us we find that the quantity of flax and tow imported into this country, in the ten months preceding the 5th November last, was 1,610,185 cwt., or upwards or 180,000,000lbs. weight; and, adding what may have arrived during November and December, we may perhaps, estimate the import for the present year at 200,000,000lbs. Now, the largest import of cotton in any one year, was in 1849, when upwards of 750,000,000lbs. were received. The import of flax therefore, is very far below that of cotton. It must, however, be borne in mind, that flax is extensively cultivated in the United Kingdom, and probably not less than from 40,000,000 to 50,000,000ibs. are annually grown at home; thus bringing up the whole supply of flax to 250,000,000 lbs., or in weight to one-third the whole import of cotton. The cultivation of flax is also engaging much of the attention of the "agricultural mind" just now, and the permanence of a moderate price of grain will induce many farmers to attempt the growth of flax. Flax, too, is an article which can be grown, not only in the United Kingdom, but to any extent in most parts of Europe, and there can be

together. It is true that flax is stronger than in diameter. cotton, but its nature is altogether different, ric than either pure cotton or linen goods :--We know that this is the case with linen weft employed on cotton warps. It makes a beautiful and strong fabric, but the nature of the two is so different, that the cloth cuts, or rather breaks like glass. And sometimes the linen weft in the loom, if the weft is drawn tight across the raceway of the shuttle, cuts the warp entirely through. This has happened frequently in a factory which we know.

Our Navigation.

The following statement shows the number and tonnage of the vessels built in each State and Territory of the United States, for the year ending on the 30th of June, 1850. It is taken from the Report of the Secretary of the Treasury, transmitting the annual report of the Register of the Treasury of the commerce and navigation of the United States for the fiscal year.

Of the vessels comprised in the table, there were two hundred and forty-seven ships, one lions of gold dug from the bowels of the earth hundred and seventeen brigs, five hundred and forty-seven schooners, two hundred and ninety sloops and canal boats, and one hundred and fifty-nine steamers. The largest number of | ing in from all directions. ships built in any State was one hundred and twenty-seven, in Maine; and the largest number of steamers, thirty-four, in Kentucky. The largest tonnage set afloat during the year is that of Maine, and the next largest of New York. Of the one hundred and fifty vessels built in Maryland, one hundred and twentyfive were schooners.

The Age of Gold.

The progress of this age shoots ahead of all calculation, and we must make up our minds to allow nothing to surprise or astonish us. It is less than seven years since our commerce in the Pacific seemed to be limited to our whalers and a few trading ships to Valparaiso and Callao. Panama was only known as a neutral ground, where a congress of nations was to be held. , Vessels occasionally reached California, and now and then a ship bound to the mouth of the Columbia River for a cargo of furs passed by the golden gates of San Francisco, when even its handful of inhabitants had no idea that they stood on mines of the precious metals; yet in that short space of time what wonderful changes have taken place! A war with Mexico-the conquest and surrender of California-millions on mil-

-a thousand ships lying in the bay of San Francisco-a hundred thousand inhabitants in San Francisco—an immense emigration pour-

Five years ago, California had a white population of less than 5,000 inhabitants. She is now a State that boasts of a population that numbers almost a half a million. Five years since, Monterey, her capital, had only 300 inhabitants. San Francisco to-day has a population four times as large as the whole country could boast of in 1845. Five years since. California was but little better than a wilderness, while her population confined their ambition almost entirely to the pleasures that spring from scratching and praying.

Fifty millions of dollars have already been exported, and millions are monthly sent to different parts of the world.

Lines of steamers already connect us with San Francisco, and other lines will soon connect San Francisco with Asia and other parts in connection with the discovery of the extinct of the world. A ship canal is constructing across the Isthmus to connect the oceans, and our great central railroads are reaching their iron arms thitherward, and in ten years we imagine they will reach the quiet city of the Pacific.

The history of the world presents nothing to be compared with the rapidity of progress, and the development of the resources of the Pacific coast. At the ratio of progress for the last five years past, one generation will not pass away before San Francisco will be numbered among the great metropolitan cities of the world; reaching one arm westward to Asia, and the other eastward to the Atlantic coast, she will grasp the trade of a large portion of the two hemispheres.

French Statistics.

The annual consumption of bonnets, in France, amounts to 25,000,000 francs. The num.

Roads.

In constructing roads it is far better to make them as level as possible at first, and rather go round than up the hills. It is calculated that the power of a horse, on a level, averages 1,000 lbs., at a moderate pace, and in a rise of 1 in 100 feet he can draw only 900; 1 in 50, 810; 1 in 44, 750; 1 in 40, 720; 1 in 30, 640; 1 in 26, 540; 1 in 24, 500; 1 in 20, 400; 1 in 10, 250. In round numbers, upon a slope of 1 in 44, or 120 feet to the mile, a horse can draw only three-quarters as much as he can upon a level; on a slope of 1 in 24, or 220 feet to a mile, he can draw only half as much; and on a slope of 1 in 10, or 528 feet to the mile, only one-quarter as much. Though a horse on a level is as strong as five men, yet on a steep hill it is less strong than three; for three men, carrying each 100 lbs., will ascend faster than a horse with 300 lbs. The popular theory that a gentle undulating road is less fatiguing to horses than one which is perfectly level, is pronounced erroneous.

New Wingless Bird.

At a recent meeting of the London Linnaean Society. Mr. Westwood called the attention of the society to a wingless bird on Lord Howe's Island—an island between New Holland and Norfolk Island. This spot had been accidentally visited by Captain Poole, of the East India's Company's service, who, considering it a favorable spot for colonization, had induced six Irishmen and their wives and families to settle on it. The place is now one of constant resort for the supply of water and provisions to the South Sea whalers. It is of considerable extent, and has on it two high hills which can be seen at a distance of sixteen leagues at sea. On this island Captain Poole had discovered the bird in question. It is about the size of a quail,-and is considered by the settlers as good eating. Mr. Westwood thought the announcement of the existence of this birdwhich was not previously known to exist in those regions-would be received with interest wingless birds of New Zealand.

Air Locomotives Again.

M. Fillopanti, a foreign gentleman a little distinguished for scientific knowledge, gave a lecture on the evening of Thursday, last week, in explanation of his method to navigate the air. Among the gentlemen of science present were Profs. Loomis, Draper, Gibbs, and others. He advocated rarified air as the cheap inflating material. He stated that an air-ship of cylindro-spherical form (Bell's) could be made to go at the rate of 11 miles per hour, carry 328 passengers, and cost only \$20,000. This ship is proposed to carry passengers to California, and is to be 120 feet in diameter. 960 feet long, with inside air at 340° of heat, to be propelled by a locomotive of 240 horse power. Besides the cost mentioned, inter mediate stations are to be made to take in supplies from, so that there will be no use of Hornblend is more tough than hard. So its exports of fine and common felt, silk, and of either Whitney or Benton's railroad being constructed-no use, for this will be an infinitely cheaper method of travelling, and surely there must be some certainty about the success of the project, when such savans as Gen. Tallmadge, President of the American Institute, and the distinguished Professors whose
