OUR FORCES APPROACHING CHARLESTON.

Just south of the entrance to Charleston harbor, is Stone inlet and creek. On the north bank of the creek lies James Island, a considerable parcel of the sacred soil. It is a low, marshy tract, forming part of the westerly bank of the Ashley river, between that and the Stono, and is the only territory between us and the city. The enemy have fortifications here and are bringing reinforcements from Savannah via the Charleston and Savannah railroad. The precise nature of their defences is coming slowly to light with cach day's advance. The Federal gun boats have succeeded in shelling out some batteries which were erected for the defence of that point and have made their way up the creek toward the city. Recent intelligence from southern journals state that the Federal forces under Generals Hunter and Benham are new en the Island and have had a spirited engagement with the enemy. No victory being claimed by them we may preperly conclude that our forces did not get worsted in the fight. A Georgia regiment was cut up severely and one colonel mortally wounded. The Federal forces there are estimated at 16,000 and appearances seemed to indicate that the enemy was very strong. We shall be very happy to chronicle the capture of this strengheld of secession. The war began there, and if judgment should earnestly begin at this point few would complain. We are anxious to hear the result of the engagement from reliable sources.

The women, children, and household property are anticipation of its early bombardment.

GEN. M'CLELLAN AND HIS COMMAND.

The Tribune correspondent writing from the battle field of Fair Oaks, and with a full knowledge of the facts says, "it would have been economical, humane and politic to have given McClellan all the disposable troops north and west of the Ohio, when he commenced the invasion of Virginia," intimating that this policy would have enabled him to have reached Richmond weeks age. If Napeleen left any legacy to the science of which he was a master, it was the concentration of forces, and the striking an enemy with everwhelming numbers, er with a rapidity ef success in blows that stun while they surprise.

The intelligence which comes from Richmond, McClellan's progress, leaves no apprehension of the result, for, as the veteran Spanish General Prim is reputed to have said, after a visit to the camp, "mortal man cannet de mere than Gen. McCellan is doing at this moment, and success is certain if you only leave him alone." Gen. McClellan's military judgment, and comprehension of the situation, are confirmed by the military criticisms in Europe, which, supposing the disposition of the troops to be his, condemn him for cutting off his army on the Peninsula from McDowell's and Banks's divisions.

MISCELLANEOUS.

General Sumner's passage of the Chickahominy river, on the first day of the battle of Fair Oaks, was one of the most daring and successful operations of the war. The correspondent of the New York World says :- "If it astenished the enemy then to learn that he had crossed, it is equally surprising to us now to learn how he did it. His rearmost battery wagons had scarcely been hauled off the floating and perilous causeway of logs before the rushing waters swept the timbers away, making huge gaps in the work, and rendering that avenue of approach entirely useless."

Camp Douglas, Chicag●, n●w embraces •ne hundred and fourteen acres. It contains 8.962 rebel priseners. Five hundred and ten have died er have been discharged.

The rebels rate their own forces at Richmond at ninety-five thousand men and McClellan's at one hundred and twenty thousend. We presume they know all about McClellan's army as hundreds of spies are continually hovering about the camp.

HOTCHKISS & Sons. of Sharon, Conn., are actively engaged in the manufacture of shot and shell for the gevernment. They empley 300 persens, and make shells varying in weight from five to one hundred and fifty pounds for different guns.

The Banger (Me.) Whig states that 100 men are employed in the granite quarries near that place on a government contract.

NOTES ON MILITARY AND NAVAL AFFAIRS. SECRETARY WELLES AND OUR IRON-CLAD NAVY.

pertant communication to the naval committee of magnesia. When pure it is white, but when it conof iron-clad war vessels, in which he states that a can be indented with the thumb-nail, and is easily radical change has commenced in the construction and armament of war ships, which dispenses with density -- some kinds will float on water while others such navies as have hitherto existed, and Congress is solicited to decide whether the government will by pipe makers. Most of the genuine meerschaum premptly take the initiatory steps to place our obtained comes from Asia, but it is also found in country in the front rank of naval powers. Secretary says :-

Secretary says:—

It is now generally conceded that vessels for fighting purposes must be heavily plated with iron if they are not built entirely of that material. In this, as in most costly fabrics, economy is reached through durability.

Iron ship building is new in this country, but few persons are engaged in it, and it is a novelty in our navy yards. Heavy iron beams, shafting and thick iron plates can be procured from only two or three parties, and then in limited quantities, and subject to great delay. Individuals have little use for iron of such magnitude as the navy must have, and there must unavoidably be great out lay to prepare for the execution of such work. With only the navy for a purchaser, there can be no competition, and the government will be compelled, under such cremstances, to pay almost any price the mills and forges may demand.

may demand.

No inconsiderable portions of an iron ship can be made and precured at the ordinary mills, and, so far as it can be done, it may be the best policy to be so supplied; but the heavy and expecsive portions cannot be so procured; and, unless the government is prepared to execute the work, it will be subject to imposition, and its vessels to marked inferiority.

The Secretary suggests that a million or two of dellars judiciously expended at present to improve being removed from Charleston, by its residents, in the machinery, &c., in some of the government yards, for fabricating the heavy iron work for vessels, "may save hundreds of dollars and the honor of the nation." A number of gunboats are now being constructed •n •ur Western waters, and a government navy yard and foundry is recommended to be established \bullet n some fav \bullet rable p \bullet int in the Mississippi Val-Secretary Welles trusts that Congress will not adjourn without making appropriations for providing such werksheps in our navy yards as will enable us to construct a first-class navy, and he enforces this suggestion by saying:

suggestion by saying:

No nation can have an advantage over us if we avail ourselves of our means and opportunities, and it is no longer doubtful that our future safety and welfare are dependent on our naval strength and efficiency. It is a duty, as well as a necessity, that we make these United States a great naval Power. We owe it to ourselves to commence at once this work, and the present Cengress should, in my opinion, take the preliminary steps at the present session for laying the foundation for the construction of a navy commensurate with the wants and magnitude of the country. The place or places, the shops and tools, and other appurtenances for this great work, must be provided in season.

It is rather mertifying to our patriotism to be informed that unless the government provides suitable work shops to manufacture the most important pertions of iron-clad vessels, it will be "subject to imposition," and "compelled, under such circumstances, to pay almost any price the mills and forges may demand.

A very general opinion prevails in the community that it costs the government more to build steamers in the national navy yards than to obtain them from private builders. And it is also believed by many persons who have given this subject attention, that any kind of iron work for war vessels, may now only 8,681,000 bushels, that of New England be furnished by several manufacturers of angle iron. shafting and rolled plates, at less cost than such work third of that required by the State; the latter is only can ever be made at any national navy yard. But sufficient for three weeks' consumption in New Engwhatever decision Congress may come to on the sub- land. ject, it is imperative that we should have an effective iron-clad navy at the earliest possible date.

LARGE profits on a small capital. This is what we are all striving to make. We cannot possibly suggest to our friends a surer or better way of realizing the above results than to invest the sum of 4 cents weekly in purchasing the Scientific American. For this trifling amount you can have our paper sent regularly to your own address or to that of any friend er neighber. We believe that such an investment would be productive of greater profits, in money and mind, than a hundred times the sum spent in any other way. Our new volume commences next week.

A MANUFACTURER in Buffalo, N. Y., is filling a large order for petroleum oil for Mexico. The shipment gees to Acapulce, and a heavy business is anticipated all along the Mexican coast

MEERSCHAUM.

This famous substance of which many tobacco The Secretary of the Navy has recently made an im-smoking pipes are made is a hydrated silicate of both houses of Congress in regard to the construction tains silicate of iron it is yellow. Good meerschaum cut with a knife. It is found of different degrees of will sink. These of medium density are preferred The Greece, Spain and Meravia. It is experted in the form of irregular blocks. In some cases meerschaum is fashioned into rough pipe bowls where it is dug, but it is mostly sent to Europe. The cities of Pesth and Vienna were formerly celebrated for their meerschaum manufactories. In forming a pipe-bowl the material is prepared for the operation by soaking it in a composition of beeswax and olive oil. The wax and oil absorbed by the meerschaum are the cause of the color produced in such pipes by smoking. The heat of the burning to bacco causes the oil of the tobacco to mix with the wax and olive oil in the meerschaum, and these gradually assume those dark tints so much prized by some inveterate smokers. In some cases the bowls of these pipes are stained artificially by soaking them in a solution of iron mixed with dragen's bloed. The white meerschaums, hewever, should always be preferred.

The scrapings of the blocks of which the solid pipes are made, are triturated and reduced to powder, then boiled in soft water until a thick paste is formed. which is molded into blocks, that are dried, then cut out into pipes as from natural blocks. There are very many pipes $s \bullet ld$ under the name $\bullet f$ meerschaum which are spurious compositions, but it is very difficult to detect the false from the true by mere inspection. Some fancy meerschaum pipes are very costly. These are mostly to be found in Austria. They are furnished with amber mouth pieces and studded with silver.

THE PATENT LAW AMENDMENT.

We regret not to have received the new Patent Bill in time to give it an intelligible review in this number. We have our suspicions that the amendments are designed in some degree to cripple the rights of applicants in their appeal privileges. We hope we are mistaken in this supposition, and that we shall get the bill in time to discuss it in our next number and before its passage through the Senate. A correspondent writing from Washington intil ates that the amendment is the result of hasty and ill-advised legislation.

Wheat and Corn Export.

In the memorial of the Hon. S. B. Ruggles to President Lincoln, regarding the enlargement of the Erie Canal, he states that in 1861 no less than 6.712.233 barrels of wheat and flour, and 6.796.390 barrels of corn were carried on the Erie canal, all of which had come from the Great West. The total product of the wheat and corn of New York growth, carried or the canal in the same year, was only 955,532 barrels The annual wheat crop of New York is stated to be only 1,077,000. The former amounts to only one-

To Preserve Strawberries.—To two pounds of fine large strawberries, add two pounds of powdered sugar, and put them in a preserving kettle, over a slow fire, till the sugar is melted; then boil them precisely twenty minutes, as fast as possible; have ready a number of small jars, and put the fruit in beiling het. Cerk and seal the jars immediately. and keep them through the summer in a cold, dry cellar. The jars must be heated before the hot fruit is poured in, otherwise they will break.

NIEPCE DE St. VICTOR is now in Paris devoting his energies in making experiments for the purpose of solving the great problem of taking photographic pictures in their natural celers.

The American Agriculturist states that the month of June is the best time to prune. A sharp knife should always be used, so as to make a clean cut.
