# Scientific American

NEW YORK, AUGUST 2, 1851.

To Patentees .--- The Policy of Publishing your Inventions in the Scientific American.

different kinds of machines; such as, ' where tute. These consist of gold and silver medals can I get a cheap and good pump? I wish to fancy and useful articles for the ladies, as preget the most approved machine for grinding | miums to those whose handiwork may prove ore; I wish to get a good and cheap steam worthy of distinction. There were 16 gold engine," &c. We answer these questions by referring to engravings in our columns, or if articles of jewelry awarded to the ladies by the information wanted is not to be found the Institute last year. The managers of this there, we candidly give them all we can on the subject. The Scientific American is now be in its seventh: and as its circulation is four times more now than it was three years ago, it follows that many are now subscribers encouragement, or rather its object, "the proour former volumes. From them we necessarily have more enquiries about machines than the old subscribers. Many have unwittingly invented and used patented machines which had been described by us years ago. They would not have done this had they been aware of the patents; they would rather have paid for their privileges. In such cases, both patentees and infringers are losers.

If we take into consideration that our population doubles itself in thirty years, a patent will, in the natural course of events, be nearly one half more valuable in its last than its first year; this is the reason why an American patent is of so much worth. Well, as our people spread so rapidly over such an extensive country, it is reasonable to conclude that many are now (and the number is fast increasing) using patented improvements without any Thomas Trimble, Woodward Abrahams, Wm. knowledge of their being the subjects of patents. There are few who like to face a law suit for the infringement of a patent, but when John Selby, the Agent of the Institute, may a person has a machine in operation for some time, not knowing that it is patented, he is more ready to resist paying even a reasonable tax than he would be if he had known about the patent in the first place. Litigation is in- October, at 7 o'clock, the exhibition will be long to him." jurious to both sides, and we believe, in fact formally opened for the reception of visitors. we know, that the patented machines which have been described in our paper have, in more instances than one, prevented law suits.

As the living and enduring testimony of an inventor's skill, the illustration of his invenfuture generations, and surely this consideraminds of patentees. A useful invention described in the Scientific American, is like a monumental statue; without such a remembrancer, without such a testimony to inventive skill, how many inventors have genius impressed upon the most useful of our unknown in story-their handiworks go down to posterity, but the hands that fashioned them are "unwept, unhonored, and unsung."

Some may say, "we are speaking for ourselves,"-we truly are not disinterested, but whether you will hear or forbear, gentlemen, it is, and will be, our object and aim to make the Scientific American interesting and useful to men of scientific and mechanical tastes. In doing so, the benefits will be reciprocal, if

to think of these things.

Maryland Institute for the Promotion of the Mechanic Arts.

It has 1,000 members, and along with the who are not acquainted with the contents of motion of the Mechanic Arts," the Institution proposes to establish a "Chemical School" upon a plan of Mr. Campbell Morfitt, a first rate analytic chemist, and author of that excellent work, "Morfitt's Applied Chemistry."

We give the Baltimore Mechanics double credit for this move. No man can be a finished engineer unless he is acquainted with chemistry. The mechanics of Baltimore enjoy a high character, and we must say they have gone far ahead of our mechanics in New York City in respect to their new Institution.

As we wish to be particular in giving all the necessary information about the Fair, we would say that there is a Standing Committee appointed, with whom intending exhibitors may communicate, post-paid. This committee consists of the following gentlemen:-Adam Denmead, Chairman; George R. Dodge, A. Boyd, John F. Meredith, Charles Suter, C. W. Bentley; Samuel E. Rice, Secretary. Mr. also be addressed.

The hall will be open for the reception of goods, on Monday, 13th of October, and on hibited before the British public, dressed in the evening of the succeeding Monday,  $20 \mathrm{th} \mid$  no other Coats than those which rightfully be-The exhibition will positively close on Wednesday night, 10th November.

Scotland, should be allowed the privilege of making one of these machines for his own use. (Clark, the thread manufacturer of the same ilk, we suppose, and a fine fellow ) Well. what does Mr. Coats, canny Tommy Coats do, butfile a caveat in London, after he went home; when applied to by Mr. Clark for a in its sixth Volume, and will, in a few weeks, partiality. The gentlemen connected with medel, he refused to accommodate him, denying that the machine brought by him from

America, was good for any thing. Mr.

Clark having assurances from Mr. Wright,

that the fact was otherwise, persisted in his

demand, and finally commenced a legal pro-

cess against Coats in order to obtain what

had been denied him. In order to sustain his

claim against Coats, Clark sent to Lowell for

the deposition of Claud Wilson, overseer of

repairs on carpet looms, through whose kind at-

tentions Coats had been enabled to obtain

the machine. Mr. Wilson's deposition was

forwarded, and also another machine by Mr.

Wright to Mr. Clark, in 1842. Mr. Clark

great inclination to push his lawsuit farther,

and how it terminated precisely we have ne-

ver ascertained. "Our Lowell mechanics, says the Advertiser, especially Mr. Claud Wilson, an intelligent gentleman, himself from Scotland, are not a little amused, on perceiving Royalty itself imposed upon by an invention claimed by one of her own subjects, but which is really of American growth—the discovery of one their own number. It is almost time that the lion's skin should be stripped from this ass of an inventor and that he should be ex-

Well, this is just the way with the world There are men who would be really ashamed to be found telling a lie or stealing, who would think these things to be great crimes, but who would make no boncs about stealing their capacity and impartiality; and in order an invention or robbing another of scientific tion published in our columns will go down to to silence all suspicion of collusion, no judge, or literary fame. We like to show up such nor any member, either of the committee on characters; and the way our people can show tion ought to weigh somewhat heavily on the exhibition or awards shall receive any premi- their appreciation of right and wrong, is to buy less of Coats' thread and more of Clark's. Contributors are assured, that the most or why don't the Lowell folks go into the scrupulous care will be bestowed by the mana- thread manufacture, they surely can get plenup machinery and make

## Bomb Lance for Shooting Wales.

A very large assembly, says the New Bedprogress by the president of the United States, ford Mercury, was gathered at Fish Island yesand Cabinet, His Excellency, the Governor of terday to witness the experiments with Allen's Md., and suite, His Honor, the Mayor, and whaling gun and patent bomb lance. Many the City Councils of Baltimore, and many of our merchants and captains were present. The lance was discharged from a gun weighing about twenty-four pounds, with the usual charge of powder, and was projected a dis-A Mr. Arstale, of Birmingham, England, tance of some forty yards, bnryingitself in the you take our advice. The that it can be used under water with equal whole apparatus is lighter than a common success. The gun can be carried to the musket, but it does not propel the bullets with shoulder with ease. The opinion of the spectators was unanimous that the experiments were perfectly successful, and demonstrated beyond cavil the practicability of using these guns in the capture of the whale.

### Patent Cases.

U. S. Circuit Court, Northern District New York, at Canandaigua, July 11th, 1851. Before Judge Nelson and a Jury.

Elisha Foote, vs. Horace Silsby, and others. This suit was for the infringement of a patent American invention, whether by a domociled granted to Elisha Foote, of Seneca Falls, N. Y., on May 26th, 1841, for a Self-Regulating Stove. The defendants pleaded non-infringement denying that the patentee was the first and original inventor, that the invention was Douglass' bobbin factory, between the Carpet not new, that it was in public use before the and Machine Shop. At his urgent solicita- patent was granted, and had been described in

> The following questions were submitted to the jury, viz:

> "First question. Was the plaintiff the original and first inventor of the application of the expansive and contracting power of a metallic rod, by different degrees of heat, to open and close a damper which governs the admission of air into a stove in which it may be used, by which a more perfect control over the heat is obtained than can be by a damper in the flue?

> "Second question. Was the plaintiff the original and first inventor of the combination described in his patent, by which the regulation of the heat of a stove in which it may be used is effected?

> The jury in answer to each of said questions, responded in the negative.

On motion of the counsel for the plaintiff, the jurors were then polled by the clerk, and they severally answered that this was their verdict.

The plaintiff and defendants belong to Seneca Falls.

## Colt's Pistol Case.

Col. Colt has an important suit now pendthus obtaining a machine, probably felt no ing before Judge Woodbury, at Boston, under the patent laws, Leavitt & Co., having as he avers, infringed upon his patent repeating pistol. The case was adjourned from last Monday, the 21st inst., to the first of August.

#### Compound Rail of the Mount Savage Iron Works.

We are glad to learn, says the American Railroad Journal, from various quarters, that the subject of the use of the compound rail, manufactured at the Mount Savave Iron Works in Maryland, is attracting a great deal of attention, and that the proprietor, J. F. Winslow, Esq., of Troy, is engaged in filling large orders with American iron. All the experience of its use thus far gives entire satisfaction. It realises the great advantages predicted of it in the abstract, while at the same time the objections which are usually made to it are shown not to exist. The compound rail is as strong as the ordinary pattern of equal weight. If such is the fact, then the saving alone over the old track will in a very few years pay the first cost of the iron, to say nothing of increased speed, greater safety of passengers, etc.

The above patern is now in use upon the Utica and Schenectady, Hudson River, Erie, Reading and some other roads, and has reeived the approbation of all the companies

## The Largest Steamer in the World.

The Eclipse, Capt. E. T. Sturgeon's new steamer, now on the stocks at Louisville, Ky., is to be three hundred and fifty-nine feet in length. She is to have eight of the largest boilers, and her water-wheel will be forty-two feet in diameter. She will be completed in the fall, and it is expected that she will make the trip from New Orleans to Louisville in four

Next week we will publish a splendid en-
