Stientifir Mlatiseniti

Artesian Wells．－The famous Artesian salt wells at Kissengen，in Batavia，commen－ ced eighteen years ago，and which it wa feared would have to be abandoned as a fail ure，has recently given the most satisfactory results．The town is located in a saline valley，nine hundred and eighty－four feet abov the level of the Baltic sea．Last June the boring had reached a depth of eighteen hundred and thirty－seven feet，and several layers of salt，separated by a atrata of granite，had been traversed，when carbonic acid gas，followed again by granite，was found．Finally，on the 12th ult．，at a depth of two thousand and six－ ty－seven feet，perseverance was rewarded by complete success．A violent explosion turst away the scafolding built to facilitate the operations，and a column of water，four and a half incher in diameter，spouted forth to the helght of ninety－eight feet above the surface The water－clear as crystal－is of a tempera－ ture of sixty－six Fahrenheit，and is abundantly charged with salt．It is calculated that the annual prodinct will be upwards of $6,600,000$ lbs．per annum，increasing the royal revenue by 300,000 florins after deducting all expen－ вея．
What has become of the Artesian Well in Charlston，S．C．Is the boring of it entirely suspended？
Importance of Pure Water for Cittle －Lawrence，in his Farmers＇and Graziers CompleteGuide，has the following
＂Dr．Jenner，who conferred that great bless－ ing on mankind－the cow－pock innoculation considered that giving pure water to cows was of more importance than persons are generally aware．There were farmers in his neighborhood，whose cows，while they drank the pond－water，were rarely ever free from red－water or swelled udders，and the losses they sustained from these causes，togetherwith the numerous abortions their cows suffered increased to an alarming extent．One of them at length，supposing that the water they drank had something to do with producing their dis． orders，sunk three wells on different parts of the farm，and pumped the water into troughs for the cattle．His success was gratifying； the red－water soon ceased，and the swellings of the udder subsided；and the produce of the renovated animals increased both in quantity and quality．Other farmers followed the same practice；and in less than six months not a case of red－water，swollen udder or abortion was heard of in the neighborhood．
Fate of Captain Taggart＇s Balloon．－ The balloon of Captain Taggart，which weno ticed last week，met with a singular fate，and came near burning up the whole of the build－ ings of a farm on Long Island．The Balloon， after it passed over this city，wended its way down to Long Island，and descended at about half－past 6 P．M．，near the farm house of a Mr．Gildersleve，in the town of Hunting ton．The car became entangled in the fence of a lane leading to the dwelling and barn while the balloon gently swayed with the wind above it．
When it was first discovered by a son of Mr．Gildersleve，it occasioned a good deal of surprise，and he called to his aid a brother and his wife，and his mother，to assist in securing it．A large opening was made in the balloon to permit the air to escape；but unfortunately at this moment one of the ladies approached the balloon with a lighted candle，when the inflammable gas trok fire，and a violent explo－ sion immediately followed，knocking down the whole party and burning the two young men severely on the face and hands．The ladies escaped with very slight injuries．Theballoon was torn to pieces，and enkindled into a blaze at the same time，and the beautiful car with its machinery greatly damaged．The varnish ed material of the balloon burnt so vividly as to set the fence on fire，which，from its prox imity to the barn and dwelling，would have undoubtedly communicated the flames to these also，but for the unusual exertions of the injured persons，who，in great agony，subdued
the fire，by tearing down the fence，and throw－
ing water upon the burning fragments of th ing water upon the burning fragments of the at the distance of several miles，and the con cussion was so great that it was sensibly ex perienced by the inmates of a dwelling half a mile distant．

## Hydrostatics．

The properties of liquids are modifid by th action of two forces，weight and molecula attraction．We can easily be led to form distinct idea of each of these forces．Let u refer to the second，or fluids in equilibrium which in that state exhibits some remarkable properties．

Fig． 1 is a versel containing liquid supposed to be without weight．ABCDEF is the vessel with a solid piston，$P$ ，which exactly covers its surface．If the piston is without weight，it is clear that the liquid experiences no pressure，but suppose the piston to be load ed with 100 lbs ，it would sink down into th liquid unless the liquid opposed such a tenden－ cy．If we divide the liquid into layers ef inches，we will find that each layer supporta the 100 lbs ．as well as the upper layer，and that the bare sustains that amount，and if we divide the base into 100 parta，each part sustains 1 lb ．The pressure therefore is trans mitted by horizontal surfaces from top to bottom without any loss ：the pressure is equal at each point，and that is proportiona to the extent of the surface under considera tion．But the peculiarity of a liquid as differ ing from a solid，is，that the effects described re produced on the sides of the vessel，as well ss the base．If a lateral opening be made in the direction A B，the liquid will fly out，and if the opening be made of a size equal to th Fig． 2.

piston，$P$ ，it will require a force of 100 lbs ．to prevent it from flowing out，but if the opening be $1-100 \mathrm{th}$ of the piston，a force of 1 lb ．，will prevent it from flowing out．
If a hole was made in the piston，$P$ ，the liquid would spout out upwaris，according to the law of action and re－action．Liquids，therefore， transmit equally，and in all directions，the pressure exerted on any part of them，and this will explain a question often asked in respect to the pressure on different areas－many hav－ ing a wrong idea of this principle．If the mall piston， 0 ，is only 1－100th time the size of $\mathrm{P}, 1 \mathrm{lb}$ ．on 0 will balance 100 on P ，and this will also explain the principle of virtual velocities，for if the piston， 0 ，be pushed in any given distance，the piston，$P$ ，will only be moved 1－100th part of that distance－a gain f power from equilibrium，like that of the common lever，which lies at the foundation of he science of mechanics，is a loss of speed． It is this principle which，for，simplicity and an absence of friction，gives such advantages to the Bramah press over the wedge，lever or screw，for some purposes．A liquid，to be in equilibrium，must have every point of its sur face perpendicular or normal to the force which acts upon it，and each particle must ex perience equal pressure in all directions．
Let us suppose the surface not perpendicu
the direction of figure 2，indicated by the line A C D E，while the force acts in the direction of the vertical lines， $\mathrm{V} V$ ．In this case the horizontal layer，B D，inust be pressed by the weight of all the particles above it，and this pressure，as already stated，being transmitted laterally，the molecule，$D$ ，would be thrust out，since there＇is no counterbalancing pres－ sure on the other side，therefore it is thrust aside and another particle occupies its place， and other particles successively take its place until the curve，A C D，has fallen into the de－ pression D E，and the whole surface is hori－ zontal，with all the particles ranged in a plane perpendicular to the force，without which there can be no equilibrium．

## Cancer Treatment．

New Orleans，Oct．27， 1850.
Gentlemen，一The following article in rela－ tion to the treatment of that worst of all diseases，the cancer，appeared in the Delta，of this city，Oct 17th，and as it contains infor mation valuable to the world，I have though proper to enclose it to you，with the hope tha it may appear in the columns of your valua ble journal，whose reputation stands high in this section．
＂This gentleman，whose success in curing some of the most inveterate cancers and tu－ mors that ever tormented humanity，may now be found at 126 Poydras streat，where he i daily visited by scores of the afflicted，few of whom are sent away without hope and the prospect of a speedy recovery．In stating this much，we only declare what we see and know． Certificates of cures－of successful medical practice－are so easily oltained，that we enerally attach but little importance to them Those who present such evidences must do so n their own responsibility．In the importan matter of preserving the health and life of people，we write editorially only what comes within our own lnowledge．
Such is the course we have uniformly adop－ ted towards Dr．Gilbert．We have seen nough of that gentleman＇s practice to con－ Ince us that he possesses an important secret r skill which enables him to master，with astonishing success，one of the most stubborn diseases＂which flesh is heir tu．＂To such well attested reputation，no college diploma could be expected to add much strength or celebrity，and therefore Dr．G．has usually eposed upon his reputation，without seeking such adventitious aids．Those who hav reputations to create may require such helps， but they have ceased to command universal confidence among the people．
Whilst，however，a diploma is by no meana needed by Dr ．G．，it is no little credit to the institution which，appreciating his great akill and success，voluntarily confers upon him this parchment distinction．Such was the case on the occasion of his late visit to Memphis，when the Medical College at that place came forwar and conferred upon him their diploma．This was an evidence of good sense and liberality in the college．We trust that the public wil not have the less confidence in the Doctor on ccount of this distinction．If they have，we an only recommend them to call and see some ases he has now under his charge，one in articular，of an hereditary cancer，which wa rapidly devouring the unhappy subject，and was given up by the most distinguished phy icians in the country，but which now，under his treatment，is rapidly recovering，and will he entirely well in a few days．＂
We have before noticed Dr．Gillert＇s success in curing the cancer，in our columns．We have no disposition to puff any man，but we would not refuse our aid in extending a knowledge of a successful treatment of this shocking disease，and we are assured the au－ thority is sufficiently good to warrant us in vouching for its accuracy．

The Charleston S．C．，Sun says ：a Conven－ ion of Manufacturers is to be held in the city of Richmond，on the 18th instant，to pre pare a suitable memorial to be presented to Congress at the commencement of the ensuing session，setting forth all the facts believed to
ng state of manufacturing industry，and urging the necessity of a speed $y$ revision of the tariff laws．

Philadelphia Art Union．
It givés us pleasure to learn that this ex ellent institution is in a flourishing condition Its subscribers for the present year have al ready exceeded the expectations of its mana ers，and the list is constantly increasing． The subscribers＇plate，this year，is the finest that we have seen exscuted in the country：A． H．Ritchie，of New York，is the artist．It is worth the whole subscription price，and this we have heard not a few say，when admiring it，in this city．

## LITERARY NOTICES

Marine and Naval architecture．－Number 1 of this incompara ble work，by John W．Griffithe，Ma ine and Naval Architect，has just been issued，and o would remind those who may be desirous ofob cining this work，but who havenot yet beoome suo nd they should at once end in their subseriptions． We understand that Mr．G．has made proposals to the Navy Department to build a war ateariner in one of the Navy Yards，using tor her frame 60 per cent． of such timber as bas been cut for steamers＇frames， but which has been condemned in consequence of its xclusive adaptation to heterogeneous nollels．The essel he proposes to build to be able to makea pas sage，in ordinary weather，from this city to Liverpool ithin nine and a half days；one of the conditions or enatruction for hal he and engines． poses to build a sailing sinip，under similar circum tances，that shall be able to out－sail any vessel of the nameamount of displacement in the navy of the United States．
Iconographic Encycloprdia．－Part 13 of this un valled work on Science，Literature and Art，jub now before us，and like its of No． 2 barclay sin ains its high character of excellence．It contain eautiful plates of the Chinese，and other Abiationa ions，the North American Indians，and Africans，in varous ponitions，exhibiting their manners and cua－ oms．Twelve more numbers will complete this ork，which will hen clopedia in our language．
Co．，publis Dramatic Works，Phillips，Sampson， O．，pk Ahers，－Number an Cresside＂embellished with e beautiful ongra ving of the latter．
