have been ueed before ly pyrotechists and others, in the manuafacture of various fire works, and that,
an regards such use,
invention
in as regaras suci uet, so far as regards the oombinatio
invention, exept siven and for the purposes mentioned. I hare given and for the purposes mentioned.
rhe shape and atarial of the cartride case
have nothing to do with invention, they being op tional with the party using them. $I$ thave only giv
en drawings of and described wat 1 have found to
be the most convenient for the purpose. bres

 described, either ringly or in pairs, but the combina-
tion of the advantages mentioned, as deseribed.

 coiled around a stationary axis, to which it is at
tached by one ent, the other end being attached to
the disc that forms the hub or centre of the gate turning on said axis, substant anly as deseribed.
Ialso claim the ses of the rock shaft provide
with the cam ledges and striabt with the cam legeses and straight ledge. to pro opera
ted upo by he the whels of the passinintrain and the
cams for winding up the chains which draw tea upon by the wheels of the passing train and the
cans for windinup the chains whith draw up the
gate, the whole being arranged in the manner and
gitat or the purpose substantially as set forth

 chain.
Nor dol claim tbe stud pin with a recess in it at
Nor a mandrel, around which the bo of of a link is bent,
while the orw on ather link is hell in the recess,
thereby forming a continu ous chain. in uhereby forming a continuous ohain.
Nor do I claim a partly revolving

 tion of welding is performed.
Secoond, attaching the vibrating arm to the bed the die, and operating the eame. in such manener an
to reeve the finishe link, and suspend the same in
one ${ }^{2}$ position to be seased
Third, the combination of the slide bar, turning
lever, and coss bant construceed and arranged as
deseribed, the said bar and
 Fourth, the link seat attached to the lever be-
neath the swazefor receiving the finished link from the suspending arrm, and holdine thin samed untril the
wire or ro, for the suceeding link, is fed into the
fin,

 pendant eam bars (two) short pendant arms (two),
the pin and spring bar, constructe, arranged, and
operating as described, whereby the finished link is
 succeeding link.
Sixth the the combination of the spring bar, with the
shan euther whereby the pendant cam bars are at
tached trount

 seri bed.
 the bast cylinder, substantially as described, wher
by $I$ attain a free escape for the blast, and effectual
 bascee oniter, shaft trius axis.

the blast tylinder, from top to bottom, for the the blast tylinder, from top toot, obtom, on, for thanesor
pose of beating the offal at each suce
vane, and preparat
tially as described.
BRAN DSEFRRS-By Abel Hildreth, of Newark. $\mathbf{O}$
I claim the arrangement and combination of the several parts of a bolt or bran dus
 ers within the bolting screen, shall act as a a convey-
or or eleatar) for the proppse of transfring the
bran or meal, from any
portion of the minl, to the bran or meal, from any portion of the mill,
boalting or thting apparatus and shall, at the
time, cool the bran or meal thus conve yed. Inalso olainm the scouring apparatusedesecribed, con-
sisting of a series of pairs of toothed discs, arranged
and in vertical order abore each other, at such distancess
apart, as will admit of the free passage of the meal, apart, as wit aum or the free passage or the meal,
or rona, betwen them, atteratel from the centre
to the periphery between the discs of each pair and to the periphery between the disss of each pair, and
from the periphery to the centre between the pairs of
of diss.
I 1 so
e
I also claim the method described of shielding the
current of mixed air and mean or bran, from the cen-
tif trifugal action of the revorving discs, by mea
stationary diaphragms, arranged as set forth.
STop Moriows of Looss-By Lora B B Hit, of
Millbury, Mass.: I claim, first, the forked lever and

 Irawn acrosesthe pins, and to thatersefitito stoperis)
some the
oom, when the shutte ceases to draw the weft aross the said gird.
Second, the spring or its equivalent, to stop the
prongs of the lever and raise the catch so as not to prongs of the ever and raise the catch so so not to
topthe toom the nthe shuttle is in the bo at he
opposite end the parts being arranged substantially
 aplunger, piston, or pistons, poppet valiees, or well
anown
knows. the same being long known and used ; sut I claim the means set forth for maintaining the
eed to the boiler, ete , and the closing or cutt off the communication to and from the meter, in
case of accident, or from other cause, arranged and
aes ation case of accident, or from
operating as described.
STMAM BoLLrRs-By James Millholland, of Read
ing, Pa.: $\mathbf{I}$ claim the contracted grate, in the fire. box, in combination with a supplementary chamber
of combustion, supplied with hair, and situated at a
 Grath and Grass Harvestrrs-By R. T. Os. good of orland, Me. I I laime the manner of placing
he toggle joint purchase (with thetransverse acting joint), upon the end of the cutter arm, to act in
conjunction with the other machinery, giving it, a ion junction with the other machinery, iviving it, a
it were, aouble purchase by hanging the twere, a double purchase, by hanging the swep,
thathearm of the crank will in horizontal or pa
ailtel with the toggle joint, when straight, and giv. ing the cutters its double motion stry actiting above abe
ngd below this tine. When the crank or hand is up. the purchase is at the upper end of the swepp, when
half way down it it is the liwe end or joint, sary-
 the method described, of preventing accidents to the
feeder of a threshivg machine, iny interposing be-
the
 lent hherefo which is arrangen o aco os, the throat of
the machine, and is supported and guided, sulstan Bandras. Puluirs-By R. W. Parker, of Roxbu.
y , Mass.: I claim arranging the driving pulley in refence. to two otherr punileys, that the buand passs
ing over these pulleys is not only pressed with anj ing over these pulleys is not only pressed witp anys
insesired foree against the periphery of the driver, but
dis
 rating upon the band a
the manner described.
CAPsTANS-By Peter Robertson of New York City
claim the combination of the following mechanical clements, viz, the vibrating tumblers, acted upon by handspikes, the slide with its racks, the cog wheels,
(two one of which is forme with ratchee teeth),
the rathet whel the rathet whee and its hollow shaft, the pawh sis thwo
he whole arranged within the hase and with respect
to each other, and acting sustantiall Rotary Culityators-By P. E. Rogese of New
 Torm in which I propose, in combination, to apply
them, to produce the advantages speciifed. I claim
 one face being a continuation of the line, or plane,
of the radius of said wheel, while the other face is bevelied, to meet it an angle somewhat iess that
forty five degrees, for the purpose of ftring into
and taking a firm hold of the ground, in the manner $\substack{\text { forty fivive de } \\ \text { and taking } \\ \text { set forth. }}$
Wriciriva Maciivs s-By Wm. \& Thos. Schneb ley, of New York City: We claim the employment of
the methoo or methods of seaurin the feveror lee

 | srcribed, $\begin{array}{l}\text { When this is ie combined with the pendulous } \\ \text { scale or balanee and the apparatus for registering }\end{array}$ |
| :--- |

 combination we are enabiled to register, accurately,
che weight of bodies that roll or side or are thrown he weight of bodies that roll or slide, or are thrown
on to the platform, and prevent tlie apparatus from registering. in andition to the a ctuit (1) weight, the mo-
mentunn of the descending weight of the body to be weighed.
And we ism. which registe
tant
tan tantially as specified, when this is combined dith
the pendulous balane, or its equivalent, and its re gister, for registering the sum of the weights weigh
ed by the pendul ous balance, subtsantially as de
de

 number of articles which make up that sum.
num
 cular construction of my spoon with a slididig bot
tom, and a piston slide, exactly fitting the earity of the spon, and the slididing rod, so arranged, that id
may be slid in the same moment that the slide
tonve or botto tongux or bottom, is drawn out thereby quickly
emptying the spon of its contents.
I do ont claim that ty spon spon should be a gradua

 arrangement, the advantage of preserving the teet th
and administering all the medicines graduated by
the the physician
ng children.

## Petitions for Extension of Patent.

Dyeing.-On the petition of Patrick Ma gennis, of Paterson, N. J., praying for the ex tension of a patent granted to him for an improvement in the art of Dyeing, for seven years from the expiration of said patent, which takes place on the twenty-first day of April, A. D. 1852.
It is ordered that the said petition be heard at the Patent Office on Monday the 19th day of April next, at 12 o'clock, m.. and all per sons are notified to appear and show cause, any they have, why said petition ought not R. C. Weightiman,
Acting Commissioner of Patents.

Spark Catcher.-On the petition of Wm T. James, of New Rochelle, New York, pray ing for the extension of a patent granted to him for an improvement in Spark Catcher for seven years from the expiration of said
patent, which takes place on the 13th day of April, 1852
It is ordered that the said petition be heard at the Patent Office on Monday the 12th of April, next, at 12 o'clock m.; and all persons are notified to appear and show cause, if any they have, why said petition ought not to be granted.
Persons opposing the extensions are required to file in the Patent Office their objections, specifically set forth in writing, at least twen ty days before the day of hearing; all testimo ny filed by either party to be used at the said hearing, must be taken and transmitted in accordance with the rules of the office, which will be furnished on application

Thos. Ewbank, Com. of Patents.
For the Scientific American.
Wooden Boxes for Machinery.
Mechanics are often called upon to run machinery at such a distance from a furnace or machine shop, as to make it very inconvenient and expensive to go to such places for light repairs, and under such circumstances I have not unfrequently been asked, " what kind of wood is the best substitute for metal boxes for light machinery, with rapid motion?"Perhaps I may usefully serve some one in such circumstances by giving a little of my obser vation and experience on the subject. From what I can learn from the testimony of others, and from my own experiments, I am satisfied that fustic is the best substitute for metal, and I incline greatly to the opinion that it is superior to most, if not all kinds of metal, as an anti-friction substance.

A few years ago I was employed to build a saw-mill under the above-mentioned cir cumstances, and having a large block of fustic at hand, I made all the principal boxes out of it; it was moved by an over-shot wheel with the segments bolted to its rim, conse quently the end of the drum shaft, to which the pinion was attached, rested on its journa close to the edge of the wheel, so as to be constantly wet. After the mill had run al most uninterruptedly for two years, I exami ned the box in which this journal ran, and although it was connected with the descending side or the wheel, and sustained all the weight peive the of the water, still I could not per inch, and all the other boxes, including those of the crank shaft, were in a similar condition on these oil was used; I have since ascertained however, that tallow is better.
About two and a half years ago I had occasion to repair a smut machine; on examining which I found that half of the box, against which the journal bore, worn out; and the journal, which was about three inches long wornaway at the upper end to about one-fourth an inch less than at the bottom, and much ridged the whole length of it. The proprietor of the mill being unwilling to stop it long enough to have the journal fitted up, I put in a box of fustic, which is still in use. A few days ago the miller informed me that for a year past it had not worn sufficiently to need drawing up, nor had it heated any during that time, although the machinery is calculated for two thousand revolutions per minute, though I presume it does not come up to that speed;
in this box tallow is used. I have frequently
used boxes of this kind for circular saw arbors, and have invariably had less trouble with them than with any other kind, either of Elmira, N. Y

## New Arrangement.

Several of our readers have expressed a wish to subscribe for some literary journal in connection with the Scientific American, not feeling able to with the publishers of the "American Model Cou ier," of Philadelphia, and the "American Union,' boston, which will enable us to furnish either or num. They are literary journals of the first order, and are
country.

An Imporinit Paragraph
Whenever our friend order numbers they have hand. We make this thent rouble to which we are subjected in replying whe he numbers called, for cannot be supplied.
The Post Office Laws do not allow publishers to nclose receipts; when the paper comes regula ubscribers may consider their money as received. Subscribers ordering books or pamphlets are par- tage.
