Scientific American

NEW YORK, FEBRUARY 25, 1854.

American Scientific Literature.

of our own and those of other countries, and of science as cultivated here and in other countries, exhibit either envy or vanity. The great and the truthful require no inflated panegyrics of friends, and they have nothing to dread from Seventeen years is a *little* too long to allow an the censure of foes. The true fame of no coun- i invention to slumber in obscurity, after the intry can be increased by detracting from that of ventor has had it in successful operation, as another; and that man is the best friend of his | Hunt asserts that he has, with the eye-pointed country, who points out her faults, for he in- needle and shuttle. cites her to deeds of true glory.

There is, no doubt, a natural and honest national pride experienced in the consideration of our own native land being the birth-place of great men ; and our feelings grow warmer when we speak of Franklin and Rittenhouse, than of Wollaston or Ferguson. America has added greatly to the domain of science, and we feel proud of her achievements, but she can and must do more.

What is our country now doing to increase her scientific fame? Much, no doubt, in every department of science and art. Our countrymen have made many valuable contributions to astronomy during the present age; and an American lady-Miss Mitchell-maintains an honorable position among the living explorers of the starry heavens. Learned societies and an admiring monarch have awarded her prizes, and presented her tokens of admiration. In electro-magnetic discovery, no nation, perhaps, equals our own. In chemistry and geology, we have many eminent names. For new and useful inventions, no country in the world, possessing an equal number of inhabitants, is so prolific, and it is to this feature in her progress, that we wish to direct attention, at present, by way of comparison.

Do we, as a nation numbering twenty-four millions of inhabitants, stand out equal to France or England in respect to scientific fame? Not if the general literature of some of our Scientific Associations, is to be taken as a criterion. We know that there are men in our country whose scientific reputation is inferior to that of no others in the world; we speak not of them, we merely allude to what may be termed the Scientific Literature of some of our " Learned Associations," which, in our opinion, does no great credit to our country. This opinion is formed, from reading some of the transactions of "The Smithsonian Institute," "The American Association for the Advancement of Science," and the "American Academy of Arts and Sciences." There is much in the proceedings of these Associations which is really valuable and instructive, but we really did not believeuntil latterly that such an amount of useless matter could have emanated from Bodies having such a reputation for learning and scientific acquirements-it is more conspicuous for futility than utility.

In all that relates to the practical and useful, ferent as night and day, and we think that for our countrymen are pre-eminent, and we are Morse to sustain a suit against the chemical telnot a little flattered that this should be so, in egraph, the result of the two being obtained the particular departments to which the "Sciby quite different means, his alphabet should entific American" is more immediately devoted. be embraced in a separate patent, as the pro-This is acknowledged by our foreign scientific duct of a process, independent of the means of cotemporaries, who speak of it in such flatterobtaining it. We cannot conceive of a subtlety sufficient to make out any just claim on the part of Hunt, and we shall be surprised if the Commissioner does not so decide.

The Late Telegraph Decision.

Since we noticed the decision of the Supreme Court of the United States, on page 173, relating to the "Great Telegraph Case," on which the Court passed its opinion of the legality of the claims of Prof. Morse's patent, we have seen a great number of articles, pro and con, on the subject, in various papers. We stated on the page referred to, that the Court had decided according to the doctrines, we had advocated in the Scientific American, namely, that an art, independent of the means of carrying it out, is not patentable. The eighth claim of the Morse patent was declared by the Court to be invalid.

"I do not propose to limit myself to the specific machinery or parts of machinery described in the foregoing specification and claims, the essence of my invention being the use of the motive power of the electric or galvanic current, which I call electro-magnetism, however developed, for the marking or printing intelligible characters, signs or letters, at any distances, being a new application of that power of which I claim to be the first inventor or discoverer."

This decision simply means, that independent of the means to accomplish a result-the machinery to produce the effect-a patent, if granted, is void. It was upon such grounds that we attacked the decision of Judge Kane, on page 67, Vol. 7, "Scientific American," wherein he stated that Morse's patent was founded on two patentable subjects; the one on the discovery of a new art; the other the means of practising it." What now becomes of the "discovered new principle," so strongly insisted upon by the Hon. Amos Kendall, in his letter to the "Scientific American," on page 170, Vol. 8."

The art of Telegraphing is not claimed in the patent of Prof. Morse, but the art of recording messages by the motive power of electro-magnetism as embraced in this eighth claim. The appeal on which the above decision was made. had no connection with the House Printing or the Bain Chemical Telegraphs, but as the fifth claim of the Morse patent is for the alphabet composed of recorded dots, spaces, and horizontal dashes, to represent words and numerals, it may prevent the use of the chemical telegraph, for which the same symbolic alphabet is used. But this has nothing to do with the principle of action of the two telegraphs, which are as dif-

Letters of precisely the same sound, and having the same name, assume different forms in our own claim to originality, we believe that the Com- | language, and still other forms in other languages, and even other names. If I have a patent for making an E, in one form, can any other person get a patent to make the same letter for the same purpose in another form?

> instrumentalities are the only proper subjects otherwise be most likely to neglect. for protection by patents, and that when patented all equivalents are infringements."

These views in defence of the Morse alphabet are exceedingly funny. Letters, according kind should be built fire proof. They generally to his theory, are not telegraphic results, only contain valuable public documents and the resinstrumentalities. The persons, therefore, who cue of them from the flames, often endangers the receive messages by Morse's Telegraph-the lives of the firemen. There is a probability receiving operators-must be the telegraph results. How innocently he asks, "if I have a patent for making E in one form, can any other person get a patent for making the same letter this matter by the authorities. The example, for the same purpose, in another form?" Certainly he can, sir. Your views of the question, if sustained, would give Prof. Morse a patent press and the public speak out relative to this for all written languages. Did he invent any matter. alphabet but his own? Did he invent the old Roman alphabet? No. How in the name of common sense, then, can any of his friends claim for him the exclusive use of that which henevor invented; of that which was used by a civilized people, when the forefathers of Prof. Morse and House could not scribble a sentence, although they no doubt knew the difference between a result and an instrumentality-a sword and a cloven head? 'It is very unwise for the friends of the Morse patent to set up such absurd claims; they do not require to do so, for they have so many strong ones to stand upon, that it seems to us they weaken their cause by assuming such untenable positions. We have always accorded to Prof. Morse the honor of being the first inventor of using the power of an electro-magnet, to record telegraph messages, and this claim, we think, he can sustain against the world. His invention is a beautiful and useful one; he is a benefactor to his race, and his telegraph is an honor to our country.

Fire-Proof Buildings for Places of Public Amusement.

all other buildings of similar character wholly fire-proof. Motives of economy alone should considerations. An additional expense of a few from the disastrous conflagration which has from it in the course of the manufacture. buried it in ruins. Indeed, the additional exin a few years.

It is well known that the rates demanded by

But there are other consideration

too small, and we would urge attention to this point. They might be usually closed, but if made to easily open outwards, they could be made available in case of an alarm of fire. At any crowded gathering there is generally much difficulty from the narrowness of the aisles and egress passages.

We think this should be made a subject of legislative interference. We know well that Letters used telegraphically are not results; such buildings are generally erected by those but they are instrumentalities. They are apart who are not likely to be most careful of the pubof the means used to communicate ideas from 'lic safety, and there is no good reason why they one mind to another. The court decides that should not be compelled to do what they would

Though the danger to human life is not so great in the case of other public buildings, yet there are ample reasons why all of these, of whatever that several important public edifices will be erected in this city within the coming year, and we hope that due attention will be given to if several splendid structures of this kind should be erected would be very valuable. Let the

Pure and Impure Gas.

It is the duty of our Municipal authorities to see that our city is supplied with pure gas for illumination. They should therefore-not unfrequently-have the gas as it comes from the burner pipes, analyzed by a competent chemist. We are confident that much of the gas which is supplied by our city Gas Companies, is very impure. All coals contain carbon, hydrogen, oxygen, and nitrogen; and bituminous coals in general, contain some sulphur. In the distillation of coal to produce illuminating gas, a considerable quantity of ammonia comes over. which, if not completely separated, is carried off with the gas, and detracts from its illuminating powers. It is also injurious to the health of the people, by mixing with the atmosphere, and being inhaled at every respiration. Being exceedingly volatile, and yet not difficult to condense,-much of it escapes through leaks in the large gas conductors, and condenses in the soil beneath the streets and buildings; this is evident, when any of our streets are trenched for the purpose of examining pipes or opening We see it stated that a new Metropolitan drains. An odor of ammonia is always observ-Hall, is to be erected in this city to take the able for a considerable space around an exposed place of the one recently destroyed by fire. If street excavation. If this is the case now, how this be so, we would direct the attention of the much worse must the evil be in nine or ten public to the necessity of having it, and indeed | years from the present date? The continued accumulation of such an impurity in the soil beneath our streets, will, in the course of time, lead to this if there were no more imperative | find its way into drains, ooze out into the atmosphere and pollute it. Nothing but pure thousand dollars properly expended at the carburetted hydrogen should ever be suffered time when the noble edifice of which we have to pass from the gas reservoirs into the conductspoken was erected, would have preserved it ing pipes; every impurity should be removed If there is any sulphur in the coal from which
