SELF-ACTING RAILROAD SWITCH.---Fig. 1. ORREA PAL TENEYUK

patent was granted to John F. Klein, of Tren- right hand side of the wedge-rail, A, as now to a truck, and a section of rail. The same let- off-rail at E. on the off-side of the switch ters refer to like parts. The object of this invention is to have a shipper or rudder on the like that of a wedge, will force the switch to engine connected to the truck, to be set by the cant the weighted lever over, and whift the the diverging tracks, the object of the invention being to set the track by the engineer, irrespective of the position of the switch to which the train is approaching. A common railroad truck is shown upon the track, on which is the peculiar switch employed, as shown in fig. 1. The switch is composed at one end of a central projecting vertical wedge rail, secured on an axis pin, and at the other end of a frog and center movable wedge rail, secured to an axis pin, also, so as to allow the switch to shift at the middle-move from side to side, to shift the track, according as the shipper is set on the truck by the engineer. Fig. 2 shows the truck. On its front end is secured the shipper, B, which is of a wedge shoe form and is bolted to a bar, b, which has a rack cut on its face, this bar is capable of sliding from side to side through guide eyes. There is a spindle or shaft extending along the truck from end to end under the wheel axles; it is supported on proper bearings, and is capable of describing about half a revolution. It has a sector, or semi-pinion keyed on its front, meshing into the

provement in Railroad Switches, for which a so that it will run along and pass on the ton, N. J., on the 27th of April, 1852. Fig- shown in fig. 1; if the shifting part of the The shipper, B, is secured in such a manner that ure 1 is a perspective view, and figure 2 is a track-where the two converging lines meet at it is capable of vibrating, or rising upwards, so transverse section, showing a shifter connected the joint, E had been so set previously that the had been on the inside, the action of B on H, engineer, to switch off the train upon any of rails, so as to place the outside off-rail out of the break at the joint, and allow the train to pass along on the inside off-rail and the outside

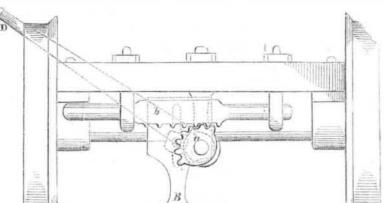

> nigh-rail, when running to the right. If the train be running in the contrary direction, the shipper is set in the same way, but

The annexed engravings are views of an im- before the train has come to the switch, the necessity of a very broad base on the wedge-rail belonging to that part of the switch which embraces the two diverging tracks. that if it should strike any obstacle on the road, or the edge of the wedge-rail, it will freely rise and do no injury. The following is, the claim of the patentee :--

> "I claim the bars or shifters, constructed, arranged, and connected to the switches of a railroad, in the manner and for the purpose as described, so that if the train run in either direction, and the rudder be placed in either position, as described, and if the switch or switches are not in a proper position, the rudder will act the central wedge-rail being set between the upon the shifters and move them gradually, as frog flanges, presses against them and shifts the train approaches, so as to move and place the switch in that manner, simply to obviate the switches in such a position that the train

Cream Freezers.

Thomas M. Powel, of the city of Baltimore, has invented a useful improvement in Cream Freezers. The apparatus has three cylindrical chambers, an outside and an inside one for the ice, with the one for the cream in the middle, so as to expose two cooling surfaces to the cream to be frozen. There is also a reticulated funnel-shaped agitator inside of the cream chamber, for the purpose of more perfect agitation, and for the removal of the cream as it is being frozen, thus allowing new unfrozen cream to be continually placed in direct contact with the cooling surfaces. Measures have been taken to secure a patent.

Nursing and Exercising Chairs for Children. Joshua Stevens, of Chicopee Falls, Mass., has taken measures to secure a patent for Nursing and Exercising Chairs for children, the object of said chair being for children of from eight to eighteen months old to exercise themselves for pleasure and amusement, and it is so made that it can weigh the child.

Ship Borer.

The Salem (Mass.) " Register " says : " There was a vessel hauled on one of our railways, last week, which exhibited a curious specimen of the destructive nature of the Toredo, or shipborer. The schooner 'Sarah Jane,' built in Marblehead only about two years ago, was laid up in some of the Beverly docks the succeeding winter, and in Salem during the last. The keel was made a complete honeycomb, and had to be entirely removed, as well as several of the planks. Some of the worms, several inches long, were found in the cavities which they had bored. There was scarcely a foot of the keel that wou d sustain its own weight.

rack, j, of the shipper bar. By moving the lever, D, to the right (fig. 2,) it is evident that the sector, a, would shift the shipper, B, to the other side of the projecting wedge-rail, A, if it was

not in the positionshown. This shipper therefore may pass on unimpeded, without the risk of is set before the train arrives at the switch so running off the track." as to take either side, right or left, of the wedgerail, A, when it comes to it; as it is this wedge-

rail which shifts the track.

end of the switch, c being a narrow movable model, and can candidly state, that it operated central wedge-rail between the two frog flanges, well-accomplishing all that its inventor has A is a single wedge-rail on the other end of the claimed for it. More information about it may creasing the length of the circuit of the heated switch. A weighted upright lever, connected be obtained by letter addressed to Mr. Klein, in the usual way to the shifting track, is also No. 67 Warren st., Trenson, N. J. shown.

taken measures to secure a patent for an improvement in Steam Boilers, which consists The rudder mentioned in the claim, we mainly in surrounding a vertical cylindrical

have called the shipper. Its office is certainly boiler with a number of flues, which spirally somewhat similar to that of a rudder. We surround it and form a communication between C, fig. 1, are the central frog flanges of one have seen this invention applied on a working the fire chamber and the chimney. These XVI. had been ordered from a celebrated sculpflues are made in the brick-work setting which surrounds the boiler, and have the effect of inproducts of combustion, thereby causing them to give out more heat to the water in the boiler,

Steam Boilers.

Supposing the shipper, B, to have been set William Kenyon, of Steubenville, Ohio, has 'the elements of combustion.

A Buried Casting.

A curious discovery has been made in Paris within a short time. A colossal statue of Louis tor, early in 1830, for the city of Bordeaux .-It was in the mold when the revolution of 1830 broke out, and it appears to have been forgotton, for it was only discovered a few days ago by some workmen who were clearing the site for some new building to be erected on the Quartier Beaujou, in Paris.
