NEW YORK, NOVEMBER 12, 1853.

Chemistry of the Universe.

Curiosity is a prominent feature of the human mind; a strong desire to pry into the unknown of the future and the past, is characteristic of all men. Subjects which must remain a mystery to man are the very ones which engage the most discussion, and were it not that science is so often dragged in to support untenable theories, we would never notice such effusions of lecture, epistle, or debate. On the evening of the 24th ult., Prof. Doremus, of this city, delivered an able lecture in the Hall of the Medical College, to demonstrate, chemically, the manner in which our planet and the universe came into existence. Adopting the nebulous theory of La Place, he laid down three propositions, viz., that this earth was first in a gaseous state, then fluid, then solid. To prove this, he said, our planet was round, a form assumed by all fluids when rotated, but not by a gas, nor a solid. This was a very good argument for the previous fluid state of our globe. But how came it to be in a fluid state? He assumed that its first state must have been gaseous; that is, that all the metals, gold, platina, rhodium, lime, magnesia, and the whole fifty-nine solid and fluid substances, of which this earth is composed, were in a state of gas. But how came they to be in a state of gas? He never went behind this question, the most difficult of all to answer, and from the present state of chemistry he could not answer it. for there are but very few substances which can be reduced to gas; therefore, the conclusion, "they never were gaseous," must hold good, until it is disproved. But allowing, for arguments sake, that the whole materials of which this universe is composed, were once in a state of gas, how came this gas to be resolved into a fluid state? Prof. Doremus performed a number of experiments, such as igniting antimony in chlorine gas, to show that there was a great amount of latent heat in gases, and asserted that "when the universe was in a gaseous state, the light and heat-imponderables-which it possessed, were in a latent state, and by the combinations of these gases light and heat were evolved, not created." But the Professor, instead of offering proof how these gases came into a fluid state, jumped at the following conclusion-the easiest way to get rid of the difficulty. "Matter, in a gaseous form, when deprived of its latent heat, assumes the liquid form. Into this then let us suppose the universe was brought. Streams of matter, all flowing to a common center, beget a rotary movement; set a liquid globe rotating on its axis and what results."-He answered this query by causing a large globe of oil to rotate in a jar of water around an iron rod passing through its center, when the oil became flattened at its poles. He then said, "by giving a great velocity to the oil, it would become a ring, and if it would break it would gather into globes and fly round the center. If it also were possible to overcome the attraction of gravitation, and different liquids were to be taken, such as one of mercury for the center, that covered with oil, then another of alcohol, and these set revolving jabout sixty thousand dollars. These are ordiaround a common axis, the lightest fluid would be formed into a ring, the denser keep the center, and the rest be broken into globes or rings. This symbolizes our planetary system; the sun in the center, the farthest planets broken into more satellites than those that are nearer the center, the earth four times denser than Jupipiter ; Saturn surrounded with rings, and all the planets and satellites moving in the same plane." This is a beautiful theory, but it is neither founded on chemical nor astronomical facts. If all the planets and their satelites were once united-a revolving fluid mass-and the planets were thrown off from one axis, then the satellites thrown from their planets, all would still be moving with the same velocity, and in the same direction ; but instead of this being true, the satellites of Uranus move in a contrary direction, notin the same plane of that planet; this one fact destroys the theory. Another is, if this 31

should rotate round the sun during one revoluwheel secured on an axis to represent the fluid our country at large. rotation of matter described by Prof. Doremus, and that composed of a number of concentric rings, to represent the matter of every planet in our system, the outermost ring will pass through more space in a given time than the interior one, but it must make a revolution in the same time. To complete the picture, the Professor should have rotated his globule of oil on a spindle unconfined in a jar of water, for no such vessel we presume was employed to confine the fluid of our universe.

The chemical theory is worse still, for although there is latent heat in the gases, no one can be deprived of that heat unless by transfer. Now this could not take place by any known law, if all the matter of the universe was in a state of gas. The law of diffusion belonging to gases is opposed to this theory, were it not so, we could have no lien on the atmosphere for a day's existence. It is composed of a light and a heavy gas; the heat of one by no natural law. can be transferred to the other nor separated. If the nebular hypothesis were true, the nitrogen (N14) of the atmosphere would lie on the surface of our planet, and the oxygen (O8) would lie and revolve on the top of it, in short, there would be no living thing on this globe. The only way whereby the rotary movement of the earth could be produced, as stated by "the Professor, by the streams "flowing to a common center," would be by the funny theory of a hole through the center of the earth spoken of by Mannertuis for the tides to run in and the tides to run out, then roll and run on the surface about-a theory just about as conclusive and sensible as the one we reviewed last week respecting the tides. Men of science in presenting any theory should never hide a single known fact opposed to it; to do so is degrading science to individual whim and conceit .-The object of all investigation in philosophy should be truth. the whole truth, and nothing but the truth.

Patent Office Report for 1852---No. 3.

EXAMINER GALE : VALUE OF PATENTS-The Report of this Examiner, for 1852, contains some very extraordinary announcements respecting the value of patents, the facts mentioned being obtained, no doubt, from the most reliable of all sources-documents of sale. It says, "a patent, if it is worth anything, when properly managed, is worth, and can be easily sold for from fifty to sixty thousand dollars. These remarks only apply to patents of minor or ordinary value, they do not include such as the telegraph, the planing machine, and the india rubber patents which are worth millions each. A man obtained a patent for a slight improvement in straw cutters, took a model of his machine through the Western States, and after a tour of eight months, returned with forty thousand dollars in cash, or its equivalent. Another inventor obtained an extension of a patent for a machine to thresh corn and clean grain, and sold it in the course of about fifteen months, for sixty thousand dollars. A thirdobtained a patent for a printer's ink, refused fifty thousand dollars, for it, and finally sold it for nary cases of minor invention, of which hundreds go out of the Patent Office every year. Experience shows that the most profitable patents are those which do not contain much real

The "Philadelphia Ledger," in noticing the fluence exerted by so many of them in favor of rational freedom, terming that influence "The miner's desk for the year, was 167; rejected | Democracy of Science." This is true. Who applicants, 256, or nearly one and a half for did more for the liberties of his country than lin? Watt and many other great men were also to one. The chemical department is under distinguished for liberal principles; but above cent, in almost every one of those men whose discoveries in science, whose inventions in mechanics, and whose works of art, have crowned the countries which gave them birth with immortal honor-Copernicus, Kepler, Newton, with him, that many patents for chemi- D'Alembert, Davy, Cuvier, Linnæus, Whitney, cal improvements have been refused with and a host of other great ones of all nations, were men of low degree. Among the living, science claims her noblest sons from the lower whereby a new manufacture is produced, should and the middle ranks. In our own country, never be rejected. A new and very simple this is particularly true, and cannot be otherwise; we can point with pride, to Hare, Henry, ces very important results. It is stated that Silliman, Maury, Smith, citizen Agassiz, and many others; in England there is Farraday, Sir David Brewster, Stephenson, Owen, Miller, and than forty-eight chemical patents were granted a host of others; in fact we do not know a scientific man by descent, among all the aristobeen well acquainted, as they were obtained cracy except, Lord Ross, who is an honor to his

> Science, also, as if to mock the claims of learning as well as noble birth, often selects her brightest gems, from the self-taught and the lowest of the lowly. Hind, the young astronothe sages of the machine shop invented the spinning frame, the steam engine, the steamopponent of no less authority than Sir Walter Scott, who asserted that a classical education would have clipped the genius of both Shakspeare and Burns.

> "Fair Science," in selecting so many ornaments of our race, from among the less wealthy classes, thereby weakens the power and tames the pride of those who trust in riches and boast of blood ; and blind indeed must that man be, who cannot see that such an influence tends to elevate the lowly and deserving workers in machine shop and factory; in short, that Science is Democratic.

Electro Magnetic Engine.

We called a few evenings since to see Professor Vergnes' new Electro Magnetic Engine, for which a patent was granted last year, (1852.) We think from what we saw of it that it was far superior to any other that we have examined except Page's, and we are inclined to think it may be superior to his. Unlike most machines a cream-like consistence, when it is put on the of its class, it can be constructed of any size, ware with a brush, and exposed to heat in an and the large machine will still have a proporenameller's furnace. This avoids the use of | tionate power to the model. We shall examine this machine again and inform our readers of the

invention; these, by multiplication (in the things produced) cause number to make up for the smallness of the profit in the individual consists in cleaning the iron well, then coating case."

These statements, coming from the Patent it in a bath of molten zinc, and from that into a bath of molten copper, and holding it therein Office, confirm a truth often asserted, that patents, when properly managed, are the best until it ceases hissing. It is then withdrawn species of property in our country; and why and cooled, when it is found coated with copper. The surface of the molten zinc, and the not? A very small improvement on a threshing molten copper is covered with pounded glass. machine, straw cutter, printer's ink, a lock or key, or whatever it may be, while it may have the substance clearly, some of the chemical paadded but a very small increase to the pricesay one-tenth-has enhanced the value ten-fold will notice the Agricultural Patents next week, to the buyer or user. This was the case with Watt's great improvement of the steam engine, as we have not room to do so in this number of the vulcanizing of gum elastic, and a thousand the Scientific American.

was granted for coating iron with copper, and result.

PRIZES !! PRIZES !!

The following Splendid Prizes will be given for the largest list of mail subscribers to the Scientific American, sent in by the first of January next:

\$100 for the largest list.		\$30 for the 7th largest list.	
\$75 for the 2d largest list.		\$25 for the 8th	ditto
\$5 0 for the 3d	ditto	\$20 for the 9th	ditto
\$45for the 4th	ditto	\$15 for the 10th	ditto
\$40 for the 5th	ditto	\$10 for the 11th	ditto
\$35 for t he 6 th	ditto	\$5 for the 12th	ditto

The cash will be paid to the order of the successful ompetitors immediately after January 1st, 1854. These prizes are worthy of an honorable and energetic competition, and we hope our readers will not let an op-portunity so favorable pass without attention.

For Terms see Prospectus on the last page.
